## GET STARTED

MMDeploy provides useful tools for deploying OpenMMLab models to various platforms and devices.

With the help of them, you can not only do model deployment using our pre-defined pipelines but also customize your own deployment pipeline.

### 1.1 Introduction

In MMDeploy, the deployment pipeline can be illustrated by a sequential modules, i.e., Model Converter, MMDeploy Model and Inference SDK.

#### 1.1.1 Model Converter

Model Converter aims at converting training models from OpenMMLab into backend models that can be run on target devices. It is able to transform PyTorch model into IR model, i.e., ONNX, TorchScript, as well as convert IR model to backend model. By combining them together, we can achieve one-click **end-to-end** model deployment.

#### 1.1.2 MMDeploy Model

MMDeploy Model is the result package exported by Model Converter. Beside the backend models, it also includes the model meta info, which will be used by Inference SDK.

### 1.1.3 Inference SDK

Inference SDK is developed by C/C++, wrapping the preprocessing, model forward and postprocessing modules in model inference. It supports FFI such as C, C++, Python, C#, Java and so on.

## 1.2 Prerequisites

In order to do an end-to-end model deployment, MMDeploy requires Python 3.6+ and PyTorch 1.5+.

**Step 0.** Download and install Miniconda from the [official website](#).

**Step 1.** Create a conda environment and activate it.

```
conda create --name mmdelay python=3.8 -y
conda activate mmdelay
```

**Step 2.** Install PyTorch following [official instructions](#), e.g.

On GPU platforms:

```
conda install pytorch=={pytorch_version} torchvision=={torchvision_version} cudatoolkit=
↪{cudatoolkit_version} -c pytorch -c conda-forge
```

On CPU platforms:

```
conda install pytorch=={pytorch_version} torchvision=={torchvision_version} cpuonly -c
↪pytorch
```

---

**Note:** On GPU platform, please ensure that {cudatoolkit\_version} matches your host CUDA toolkit version. Otherwise, it probably brings in conflicts when deploying model with TensorRT.

---

## 1.3 Installation

We recommend that users follow our best practices installing MMDeploy.

**Step 0.** Install [MMCV](#).

```
pip install -U openmim
mim install mmengine
mim install "mimcv>=2.0.0rc2"
```

**Step 1.** Install MMDeploy and inference engine

We recommend using MMDeploy precompiled package as our best practice. You can download them from [here](#) according to your target platform and device.

The supported platform and device matrix is presented as following:

**Note:** if MMDeploy prebuilt package doesn't meet your target platforms or devices, please [build MMDeploy from source](#)

Take the latest precompiled package as example, you can install it as follows:

```
# install MMDeploy
wget https://github.com/open-mmlab/mmdploy/releases/download/v1.0.0rc3/mmdploy-1.0.
↳0rc3-linux-x86_64-onnxruntime1.8.1.tar.gz
tar -zxvf mmdploy-1.0.0rc3-linux-x86_64-onnxruntime1.8.1.tar.gz
cd mmdploy-1.0.0rc3-linux-x86_64-onnxruntime1.8.1
pip install dist/mmdploy-1.0.0rc3-py3-none-linux_x86_64.whl
pip install sdk/python/mmdploy_python-1.0.0rc3-cp38-none-linux_x86_64.whl
cd ..
# install inference engine: ONNX Runtime
pip install onnxruntime==1.8.1
wget https://github.com/microsoft/onnxruntime/releases/download/v1.8.1/onnxruntime-linux-
↳x64-1.8.1.tgz
tar -zxvf onnxruntime-linux-x64-1.8.1.tgz
export ONNXRUNTIME_DIR=$(pwd)/onnxruntime-linux-x64-1.8.1
export LD_LIBRARY_PATH=$ONNXRUNTIME_DIR/lib:$LD_LIBRARY_PATH
```

```
# install MMDeploy
wget https://github.com/open-mmlab/mmdploy/releases/download/v1.0.0rc3/mmdploy-1.0.
↳0rc3-linux-x86_64-cuda11.1-tensorrt8.2.3.0.tar.gz
tar -zxvf mmdploy-1.0.0rc3-linux-x86_64-cuda11.1-tensorrt8.2.3.0.tar.gz
cd mmdploy-1.0.0rc3-linux-x86_64-cuda11.1-tensorrt8.2.3.0
pip install dist/mmdploy-1.0.0rc3-py3-none-linux_x86_64.whl
pip install sdk/python/mmdploy_python-1.0.0rc3-cp38-none-linux_x86_64.whl
cd ..
# install inference engine: TensorRT
# !!! Download TensorRT-8.2.3.0 CUDA 11.x tar package from NVIDIA, and extract it to the
↳current directory
pip install TensorRT-8.2.3.0/python/tensorrt-8.2.3.0-cp38-none-linux_x86_64.whl
pip install pycuda
export TENSORRT_DIR=$(pwd)/TensorRT-8.2.3.0
export LD_LIBRARY_PATH=${TENSORRT_DIR}/lib:$LD_LIBRARY_PATH
# !!! Download cuDNN 8.2.1 CUDA 11.x tar package from NVIDIA, and extract it to the
↳current directory
export CUDNN_DIR=$(pwd)/cuda
export LD_LIBRARY_PATH=$CUDNN_DIR/lib64:$LD_LIBRARY_PATH
```

Please learn its prebuilt package from this guide.

## 1.4 Convert Model

After the installation, you can enjoy the model deployment journey starting from converting PyTorch model to backend model by running tools/deploy.py.

Based on the above settings, we provide an example to convert the Faster R-CNN in [MMDetection](#) to TensorRT as below:

```
# clone mmdploy to get the deployment config. `--recursive` is not necessary
git clone -b dev-1.x https://github.com/open-mmlab/mmdploy.git

# clone mmdetection repo. We have to use the config file to build PyTorch nn module
git clone -b 3.x https://github.com/open-mmlab/mmdetection.git
```

(continues on next page)

(continued from previous page)

```

cd mmdetection
mim install -v -e .
cd ..

# download Faster R-CNN checkpoint
wget -P checkpoints https://download.openmmlab.com/mmdetection/v2.0/faster_rcnn/faster_
rcnn_r50_fpn_1x_coco/faster_rcnn_r50_fpn_1x_coco_20200130-047c8118.pth

# run the command to start model conversion
python mmdeploy/tools/deploy.py \
    mmdetection/configs/mmdet/detection/detection_tensorrt_dynamic-320x320-1344x1344.py \
    mmdetection/configs/faster_rcnn/faster-rcnn_r50_fpn_1x_coco.py \
    checkpoints/faster_rcnn_r50_fpn_1x_coco_20200130-047c8118.pth \
    mmdetection/demo/demo.jpg \
    --work-dir mmdeploy_model/faster-rcnn \
    --device cuda \
    --dump-info

```

The converted model and its meta info will be found in the path specified by `--work-dir`. And they make up of MMDeploy Model that can be fed to MMDeploy SDK to do model inference.

For more details about model conversion, you can read [how\\_to\\_convert\\_model](#). If you want to customize the conversion pipeline, you can edit the config file by following [this](#) tutorial.

**Tip:** If MMDeploy-ONNXRuntime prebuilt package is installed, you can convert the above model to onnx model and perform ONNX Runtime inference just by changing ‘`detection_tensorrt_dynamic-320x320-1344x1344.py`’ to ‘`detection_onnxruntime_dynamic.py`’ and making ‘`-device`’ as ‘`cpu`’.

## 1.5 Inference Model

After model conversion, we can perform inference not only by Model Converter but also by Inference SDK.

### 1.5.1 Inference by Model Converter

Model Converter provides a unified API named as `inference_model` to do the job, making all inference backends API transparent to users. Take the previous converted Faster R-CNN tensorrt model for example,

```

from mmdeploy.apis import inference_model
result = inference_model(
    model_cfg='mmdetection/configs/faster_rcnn/faster_rcnn_r50_fpn_1x_coco.py',
    deploy_cfg='mmdetection/configs/mmdet/detection/detection_tensorrt_dynamic-320x320-
1344x1344.py',
    backend_files=['mmdeploy_model/faster-rcnn/end2end.engine'],
    img='mmdetection/demo/demo.jpg',
    device='cuda:0')

```

**Note:** ‘`backend_files`’ in this API refers to backend engine file path, which MUST be put in a list, since some inference

engines like OpenVINO and ncnn separate the network structure and its weights into two files.

## 1.5.2 Inference by SDK

You can directly run MMDeploy demo programs in the precompiled package to get inference results.

```
cd mmdeploy-1.0.0rc3-linux-x86_64-cuda11.1-tensorrt8.2.3.0
# run python demo
python sdk/example/python/object_detection.py cuda ../mmdeploy_model/faster-rcnn ../
↳ mmdetection/demo/demo.jpg
# run C/C++ demo
export LD_LIBRARY_PATH=$(pwd)/sdk/lib:$LD_LIBRARY_PATH
./sdk/bin/object_detection cuda ../mmdeploy_model/faster-rcnn ../mmdetection/demo/demo.
↳ jpg
```

**Note:** In the above command, the input model is SDK Model path. It is NOT engine file path but actually the path passed to `-work-dir`. It not only includes engine files but also meta information like ‘deploy.json’ and ‘pipeline.json’.

In the next section, we will provide examples of deploying the converted Faster R-CNN model talked above with SDK different FFI (Foreign Function Interface).

### Python API

```
from mmdeploy_python import Detector
import cv2

img = cv2.imread('mmdetection/demo/demo.jpg')

# create a detector
detector = Detector(model_path='mmdeploy_models/faster-rcnn', device_name='cuda', device_
↳ id=0)
# run the inference
bboxes, labels, _ = detector(img)
# Filter the result according to threshold
indices = [i for i in range(len(bboxes))]
for index, bbox, label_id in zip(indices, bboxes, labels):
    [left, top, right, bottom], score = bbox[0:4].astype(int), bbox[4]
    if score < 0.3:
        continue
    cv2.rectangle(img, (left, top), (right, bottom), (0, 255, 0))

cv2.imwrite('output_detection.png', img)
```

You can find more examples from [here](#).

## C++ API

Using SDK C++ API should follow next pattern,

Now let's apply this procedure on the above Faster R-CNN model.

```
#include <cstdlib>
#include <opencv2/opencv.hpp>
#include "mmdeploy/detector.hpp"

int main() {
    const char* device_name = "cuda";
    int device_id = 0;
    std::string model_path = "mmdeploy_model/faster-rcnn";
    std::string image_path = "mmdetection/demo/demo.jpg";

    // 1. load model
    mmdeploy::Model model(model_path);
    // 2. create predictor
    mmdeploy::Detector detector(model, mmdeploy::Device{device_name, device_id});
    // 3. read image
    cv::Mat img = cv::imread(image_path);
    // 4. inference
    auto dets = detector.Apply(img);
    // 5. deal with the result. Here we choose to visualize it
    for (int i = 0; i < dets.size(); ++i) {
        const auto& box = dets[i].bbox;
        fprintf(stdout, "box %d, left=%.2f, top=%.2f, right=%.2f, bottom=%.2f, label=%d, \u2192score=%.4f\n",
            i, box.left, box.top, box.right, box.bottom, dets[i].label_id, dets[i].
            \u2192score);
        if (bboxes[i].score < 0.3) {
            continue;
        }
        cv::rectangle(img, cv::Point{(int)box.left, (int)box.top},
            cv::Point{(int)box.right, (int)box.bottom}, cv::Scalar{0, 255, 0});
    }
    cv::imwrite("output_detection.png", img);
    return 0;
}
```

When you build this example, try to add MMDeploy package in your CMake project as following. Then pass `-DMMDeploy_DIR` to cmake, which indicates the path where `MMDeployConfig.cmake` locates. You can find it in the prebuilt package.

```
find_package(MMDeploy REQUIRED)
target_link_libraries(${name} PRIVATE mmdeploy ${OpenCV_LIBS})
```

For more SDK C++ API usages, please read these [samples](#).

For the rest C, C# and Java API usages, please read [C demos](#), [C# demos](#) and [Java demos](#) respectively. We'll talk about

them more in our next release.

### Accelerate preprocessingExperimental

If you want to fuse preprocess for acceleration please refer to this doc

## 1.6 Evaluate Model

You can test the performance of deployed model using `tool/test.py`. For example,

```
python ${MMDEPLOY_DIR}/tools/test.py \  
    ${MMDEPLOY_DIR}/configs/detection/detection_tensorrt_dynamic-320x320-1344x1344.py \  
    ${MMDT_DIR}/configs/faster_rcnn/faster_rcnn_r50_fpn_1x_coco.py \  
    --model ${BACKEND_MODEL_FILES} \  
    --metrics ${METRICS} \  
    --device cuda:0
```

---

**Note:** Regarding the `--model` option, it represents the converted engine files path when using Model Converter to do performance test. But when you try to test the metrics by Inference SDK, this option refers to the directory path of MMDeploy Model.

---

You can read [how to evaluate a model](#) for more details.

## BUILD FROM SOURCE

### 2.1 Download

```
git clone -b 1.x git@github.com:open-mmlab/mmddeploy.git --recursive
```

Note:

- If fetching submodule fails, you could get submodule manually by following instructions:

```
cd mmddeploy
git clone git@github.com:NVIDIA/cub.git third_party/cub
cd third_party/cub
git checkout c3cceac115

# go back to third_party directory and git clone pybind11
cd ..
git clone git@github.com:pybind/pybind11.git pybind11
cd pybind11
git checkout 70a58c5
```

- If it fails when `git clone` via SSH, you can try the HTTPS protocol like this:

```
git clone -b 1.x https://github.com/open-mmlab/mmddeploy.git --recursive
```

### 2.2 Build

Please visit the following links to find out how to build MMDeploy according to the target platform.

- [Linux-x86\\_64](#)
- [Windows](#)
- [Android-aarch64](#)
- [NVIDIA Jetson](#)
- [SNPE](#)
- [RISC-V](#)
- [Rockchip](#)

## USE DOCKER IMAGE

We provide two dockerfiles for CPU and GPU respectively. For CPU users, we install MMDeploy with ONNXRuntime, ncnn and OpenVINO backends. For GPU users, we install MMDeploy with TensorRT backend. Besides, users can install mmdeploy with different versions when building the docker image.

### 3.1 Build docker image

For CPU users, we can build the docker image with the latest MMDeploy through:

```
cd mmdeploy
docker build docker/CPU/ -t mmdeploy:master-cpu
```

For GPU users, we can build the docker image with the latest MMDeploy through:

```
cd mmdeploy
docker build docker/GPU/ -t mmdeploy:master-gpu
```

For installing MMDeploy with a specific version, we can append `--build-arg VERSION=${VERSION}` to build command. GPU for example:

```
cd mmdeploy
docker build docker/GPU/ -t mmdeploy:0.1.0 --build-arg VERSION=0.1.0
```

For installing libs with the aliyun source, we can append `--build-arg USE_SRC_INSIDE=${USE_SRC_INSIDE}` to build command.

```
# GPU for example
cd mmdeploy
docker build docker/GPU/ -t mmdeploy:inside --build-arg USE_SRC_INSIDE=true

# CPU for example
cd mmdeploy
docker build docker/CPU/ -t mmdeploy:inside --build-arg USE_SRC_INSIDE=true
```

## 3.2 Run docker container

After building the docker image succeed, we can use `docker run` to launch the docker service. GPU docker image for example:

```
docker run --gpus all -it mmdeploy:master-gpu
```

## 3.3 FAQs

1. CUDA error: the provided PTX was compiled with an unsupported toolchain:

As described [here](#), update the GPU driver to the latest one for your GPU.

2. docker: Error response from daemon: could not select device driver “” with capabilities: [gpu].

```
# Add the package repositories
distribution=$(. /etc/os-release;echo $ID$VERSION_ID)
curl -s -L https://nvidia.github.io/nvidia-docker/gpgkey | sudo apt-key add -
curl -s -L https://nvidia.github.io/nvidia-docker/$distribution/nvidia-docker.list_
↪ | sudo tee /etc/apt/sources.list.d/nvidia-docker.list

sudo apt-get update && sudo apt-get install -y nvidia-container-toolkit
sudo systemctl restart docker
```

## BUILD FROM SCRIPT

Through user investigation, we know that most users are already familiar with python and torch before using mmdeploy. Therefore we provide scripts to simplify mmdeploy installation.

Assuming you already have

- python3 -m pip (conda or pyenv)
- nvcc (depends on inference backend)
- torch (not compulsory)

run this script to install mmdeploy + ncnn backend, nproc is not compulsory.

```
$ cd /path/to/mmdelay
$ python3 tools/scripts/build_ubuntu_x64_ncnn.py
..
```

A sudo password may be required during this time, and the script will try its best to build and install mmdeploy SDK and demo:

- Detect host OS version, make job number, whether use root and try to fix python3 -m pip
- Find the necessary basic tools, such as g++-7, cmake, wget, etc.
- Compile necessary dependencies, such as pycnn, protobuf

The script will also try to avoid affecting host environment:

- The dependencies of source code compilation are placed in the mmdeploy-dep directory at the same level as mmdeploy
- The script would not modify variables such as PATH, LD\_LIBRARY\_PATH, PYTHONPATH, etc.
- The environment variables that need to be modified will be printed, **please pay attention to the final output**

The script will eventually execute python3 tools/check\_env.py, the successful installation should display the version number of the corresponding backend and ops\_is\_available: True, for example:

```
$ python3 tools/check_env.py
..
2022-09-13 14:49:13,767 - mmdeploy - INFO - *****Backend information*****
2022-09-13 14:49:14,116 - mmdeploy - INFO - onnxruntime: 1.8.0 ops_is_available :_
↪True
2022-09-13 14:49:14,131 - mmdeploy - INFO - tensorrt: 8.4.1.5 ops_is_available :_
↪True
2022-09-13 14:49:14,139 - mmdeploy - INFO - ncnn: 1.0.20220901 ops_is_available :_
↪True
```

(continues on next page)

(continued from previous page)

```
2022-09-13 14:49:14,150 - mmdeploy - INFO - pplnn_is_avaliabile: True
..
```

Here is the verified installation script. If you want mmdeploy to support multiple backends at the same time, you can execute each script once:

## **CMAKE BUILD OPTION SPEC**

## HOW TO CONVERT MODEL

This tutorial briefly introduces how to export an OpenMMLab model to a specific backend using MMDeploy tools.  
Notes:

- Supported backends are *ONNXRuntime*, *TensorRT*, *ncnn*, *PPLNN*, *OpenVINO*.
- Supported codebases are *MMClassification*, *MMDetection*, *MMSegmentation*, *MMOCR*, *MMEdition*.

### 6.1 How to convert models from Pytorch to other backends

#### 6.1.1 Prerequisite

1. Install and build your target backend. You could refer to *ONNXRuntime-install*, *TensorRT-install*, *ncnn-install*, *PPLNN-install*, *OpenVINO-install* for more information.
2. Install and build your target codebase. You could refer to *MMClassification-install*, *MMDetection-install*, *MMSegmentation-install*, *MMOCR-install*, *MMEdition-install*.

#### 6.1.2 Usage

```
python ./tools/deploy.py \  
    ${DEPLOY_CFG_PATH} \  
    ${MODEL_CFG_PATH} \  
    ${MODEL_CHECKPOINT_PATH} \  
    ${INPUT_IMG} \  
    --test-img ${TEST_IMG} \  
    --work-dir ${WORK_DIR} \  
    --calib-dataset-cfg ${CALIB_DATA_CFG} \  
    --device ${DEVICE} \  
    --log-level INFO \  
    --show \  
    --dump-info
```

### 6.1.3 Description of all arguments

- `deploy_cfg` : The deployment configuration of mmdeploy for the model, including the type of inference framework, whether quantize, whether the input shape is dynamic, etc. There may be a reference relationship between configuration files, `mmdeploy/mmccls/classification_ncnn_static.py` is an example.
- `model_cfg` : Model configuration for algorithm library, e.g. `mmclassification/configs/vision_transformer/vit-base-p32_ft-64xb64_in1k-384.py`, regardless of the path to mmdeploy.
- `checkpoint` : torch model path. It can start with http/https, see the implementation of `mmcv.FileClient` for details.
- `img` : The path to the image or point cloud file used for testing during the model conversion.
- `--test-img` : The path of the image file that is used to test the model. If not specified, it will be set to `None`.
- `--work-dir` : The path of the work directory that is used to save logs and models.
- `--calib-dataset-cfg` : Only valid in int8 mode. The config used for calibration. If not specified, it will be set to `None` and use the “val” dataset in the model config for calibration.
- `--device` : The device used for model conversion. If not specified, it will be set to `cpu`. For trt, use `cuda:0` format.
- `--log-level` : To set log level which in 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. If not specified, it will be set to `INFO`.
- `--show` : Whether to show detection outputs.
- `--dump-info` : Whether to output information for SDK.

### 6.1.4 How to find the corresponding deployment config of a PyTorch model

1. Find the model's codebase folder in `configs/`. For converting a yolov3 model, you need to check `configs/mmdet` folder.
2. Find the model's task folder in `configs/codebase_folder/`. For a yolov3 model, you need to check `configs/mmdet/detection` folder.
3. Find the deployment config file in `configs/codebase_folder/task_folder/`. For deploying a yolov3 model to the onnx backend, you could use `configs/mmdet/detection/detection_onnxruntime_dynamic.py`.

### 6.1.5 Example

```
python ./tools/deploy.py \
  configs/mmdet/detection/detection_tensorrt_dynamic-320x320-1344x1344.py \
  $PATH_TO_MMDET/configs/yolo/yolov3_d53_8xb8-ms-608-273e_coco.py \
  $PATH_TO_MMDET/checkpoints/yolo/yolov3_d53_mstrain-608_273e_coco_20210518_115020-
  ↪a2c3acb8.pth \
  $PATH_TO_MMDET/demo/demo.jpg \
  --work-dir work_dir \
  --show \
  --device cuda:0
```

## 6.2 How to evaluate the exported models

You can try to evaluate model, referring to *how\_to\_evaluate\_a\_model*.

## 6.3 List of supported models exportable to other backends

Refer to *Support model list*

## HOW TO WRITE CONFIG

This tutorial describes how to write a config for model conversion and deployment. A deployment config includes `onnx config`, `codebase config`, `backend config`.

- *How to write config*
  - 1. *How to write onnx config*
    - \* *Description of onnx config arguments*
    - \* *Example*
    - \* *If you need to use dynamic axes*
      - *Example*
  - 2. *How to write codebase config*
    - \* *Description of codebase config arguments*
      - *Example*
  - 3. *How to write backend config*
    - \* *Example*
  - 4. *A complete example of mmcls on TensorRT*
  - 5. *The name rules of our deployment config*
    - \* *Example*
  - 6. *How to write model config*

### 7.1 1. How to write onnx config

Onnx config to describe how to export a model from pytorch to onnx.

### 7.1.1 Description of onnx config arguments

- `type`: Type of config dict. Default is `onnx`.
- `export_params`: If specified, all parameters will be exported. Set this to `False` if you want to export an untrained model.
- `keep_initializers_as_inputs`: If `True`, all the initializers (typically corresponding to parameters) in the exported graph will also be added as inputs to the graph. If `False`, then initializers are not added as inputs to the graph, and only the non-parameter inputs are added as inputs.
- `opset_version`: Opset\_version is 11 by default.
- `save_file`: Output onnx file.
- `input_names`: Names to assign to the input nodes of the graph.
- `output_names`: Names to assign to the output nodes of the graph.
- `input_shape`: The height and width of input tensor to the model.

### 7.1.2 Example

```
onnx_config = dict(  
    type='onnx',  
    export_params=True,  
    keep_initializers_as_inputs=False,  
    opset_version=11,  
    save_file='end2end.onnx',  
    input_names=['input'],  
    output_names=['output'],  
    input_shape=None)
```

### 7.1.3 If you need to use dynamic axes

If the dynamic shape of inputs and outputs is required, you need to add `dynamic_axes` dict in `onnx config`.

- `dynamic_axes`: Describe the dimensional information about input and output.

#### Example

```
dynamic_axes={  
    'input': {  
        0: 'batch',  
        2: 'height',  
        3: 'width'  
    },  
    'dets': {  
        0: 'batch',  
        1: 'num_dets',  
    },  
    'labels': {  
        0: 'batch',  
        1: 'num_dets',  
    },  
}
```

(continues on next page)

(continued from previous page)

```
    },
}
```

## 7.2 2. How to write codebase config

Codebase config part contains information like codebase type and task type.

### 7.2.1 Description of codebase config arguments

- `type`: Model's codebase, including `mmcls`, `mmdet`, `mmseg`, `mmocr`, `mmedit`.
- `task`: Model's task type, referring to List of tasks in all codebases.

#### Example

```
codebase_config = dict(type='mmcls', task='Classification')
```

## 7.3 3. How to write backend config

The backend config is mainly used to specify the backend on which model runs and provide the information needed when the model runs on the backend, referring to [ONNX Runtime](#), [TensorRT](#), [ncnn](#), [PPLNN](#).

- `type`: Model's backend, including `onnxruntime`, `ncnn`, `pplnn`, `tensorrt`, `openvino`.

### 7.3.1 Example

```
backend_config = dict(
    type='tensorrt',
    common_config=dict(
        fp16_mode=False, max_workspace_size=1 << 30),
    model_inputs=[
        dict(
            input_shapes=dict(
                input=dict(
                    min_shape=[1, 3, 512, 1024],
                    opt_shape=[1, 3, 1024, 2048],
                    max_shape=[1, 3, 2048, 2048]))))
    ])
```

## 7.4 4. A complete example of mmcls on TensorRT

Here we provide a complete deployment config from mmcls on TensorRT.

```
codebase_config = dict(type='mmcls', task='Classification')

backend_config = dict(
    type='tensorrt',
    common_config=dict(
        fp16_mode=False,
        max_workspace_size=1 << 30),
    model_inputs=[
        dict(
            input_shapes=dict(
                input=dict(
                    min_shape=[1, 3, 224, 224],
                    opt_shape=[4, 3, 224, 224],
                    max_shape=[64, 3, 224, 224]))))]

onnx_config = dict(
    type='onnx',
    dynamic_axes={
        'input': {
            0: 'batch',
            2: 'height',
            3: 'width'
        },
        'output': {
            0: 'batch'
        }
    },
    export_params=True,
    keep_initializers_as_inputs=False,
    opset_version=11,
    save_file='end2end.onnx',
    input_names=['input'],
    output_names=['output'],
    input_shape=[224, 224])
```

## 7.5 5. The name rules of our deployment config

There is a specific naming convention for the filename of deployment config files.

```
(task name)_(backend name)_(dynamic or static).py
```

- **task name**: Model's task type.
- **backend name**: Backend's name. Note if you use the quantization function, you need to indicate the quantization type. Just like `tensorrt-int8`.
- **dynamic or static**: Dynamic or static export. Note if the backend needs explicit shape information, you need to add a description of input size with `height x width` format. Just like `dynamic-512x1024-2048x2048`, it

means that the min input shape is 512x1024 and the max input shape is 2048x2048.

### 7.5.1 Example

```
detection_tensorrt-int8_dynamic-320x320-1344x1344.py
```

## 7.6 6. How to write model config

According to model's codebase, write the model config file. Model's config file is used to initialize the model, referring to [MMClassification](#), [MMDetection](#), [MMSegmentation](#), [MMOCR](#), [MMEdition](#).

## HOW TO EVALUATE MODEL

After converting a PyTorch model to a backend model, you may evaluate backend models with `tools/test.py`

### 8.1 Prerequisite

Install MMDeploy according to [get-started](#) instructions. And convert the PyTorch model or ONNX model to the backend model by following the [guide](#).

### 8.2 Usage

```
python tools/test.py \
  ${DEPLOY_CFG} \
  ${MODEL_CFG} \
  --model ${BACKEND_MODEL_FILES} \
  [--out ${OUTPUT_PKL_FILE}] \
  [--format-only] \
  [--metrics ${METRICS}] \
  [--show] \
  [--show-dir ${OUTPUT_IMAGE_DIR}] \
  [--show-score-thr ${SHOW_SCORE_THR}] \
  --device ${DEVICE} \
  [--cfg-options ${CFG_OPTIONS}] \
  [--metric-options ${METRIC_OPTIONS}]
  [--log2file work_dirs/output.txt]
  [--batch-size ${BATCH_SIZE}]
  [--speed-test] \
  [--warmup ${WARM_UP}] \
  [--log-interval ${LOG_INTERVERL}] \
```

## 8.3 Description of all arguments

- `deploy_cfg`: The config for deployment.
- `model_cfg`: The config of the model in OpenMMLab codebases.
- `--model`: The backend model file. For example, if we convert a model to TensorRT, we need to pass the model file with “.engine” suffix.
- `--out`: The path to save output results in pickle format. (The results will be saved only if this argument is given)
- `--format-only`: Whether format the output results without evaluation or not. It is useful when you want to format the result to a specific format and submit it to the test server
- `--metrics`: The metrics to evaluate the model defined in OpenMMLab codebases. e.g. “segm”, “proposal” for COCO in mmdet, “precision”, “recall”, “f1\_score”, “support” for single label dataset in mmcls.
- `--show`: Whether to show the evaluation result on the screen.
- `--show-dir`: The directory to save the evaluation result. (The results will be saved only if this argument is given)
- `--show-score-thr`: The threshold determining whether to show detection bounding boxes.
- `--device`: The device that the model runs on. Note that some backends restrict the device. For example, TensorRT must run on cuda.
- `--cfg-options`: Extra or overridden settings that will be merged into the current deploy config.
- `--metric-options`: Custom options for evaluation. The key-value pair in `xxx=yyy` format will be kwargs for `dataset.evaluate()` function.
- `--log2file`: log evaluation results (and speed) to file.
- `--batch-size`: the batch size for inference, which would override `samples_per_gpu` in data config. Default is 1. Note that not all models support `batch_size>1`.
- `--speed-test`: Whether to activate speed test.
- `--warmup`: warmup before counting inference elapse, require setting speed-test first.
- `--log-interval`: The interval between each log, require setting speed-test first.

\* Other arguments in `tools/test.py` are used for speed test. They have no concern with evaluation.

## 8.4 Example

```
python tools/test.py \
  configs/mmdet/classification_onnxruntime_static.py \
  {MMCLS_DIR}/configs/resnet/resnet50_b32x8_imagenet.py \
  --model model.onnx \
  --out out.pkl \
  --device cpu \
  --speed-test
```

## 8.5 Note

- The performance of each model in [OpenMMLab](#) codebases can be found in the document of each codebase.

## QUANTIZE MODEL

### 9.1 Why quantization ?

The fixed-point model has many advantages over the fp32 model:

- Smaller size, 8-bit model reduces file size by 75%
- Benefit from the smaller model, the Cache hit rate is improved and inference would be faster
- Chips tend to have corresponding fixed-point acceleration instructions which are faster and less energy consumed (int8 on a common CPU requires only about 10% of energy)

APK file size and heat generation are key indicators while evaluating mobile APP; On server side, quantization means that you can increase model size in exchange for precision and keep the same QPS.

### 9.2 Post training quantization scheme

Taking ncnn backend as an example, the complete workflow is as follows:

mmdeploy generates quantization table based on static graph (onnx) and uses backend tools to convert fp32 model to fixed point.

mmdeploy currently supports ncnn with PTQ.

### 9.3 How to convert model

*After mmdeploy installation*, install ppq

```
git clone https://github.com/openppl-public/ppq.git
cd ppq
pip install -r requirements.txt
python3 setup.py install
```

Back in mmdeploy, enable quantization with the option 'tools/deploy.py -quant'.

```
cd /path/to/mmdeploy

export MODEL_CONFIG=/home/rg/konghuanjun/mmclassification/configs/resnet/resnet18_8xb32_
↪in1k.py
export MODEL_PATH=https://download.openmmlab.com/mmcclassification/v0/resnet/resnet18_
↪8xb32_in1k_20210831-fbbb1da6.pth
```

(continues on next page)

(continued from previous page)

```
# get some imagenet sample images
git clone https://github.com/nihui/imagenet-sample-images --depth=1

# quantize
python3 tools/deploy.py configs/mmcls/classification_ncnn-int8_static.py ${MODEL_
↪CONFIG} ${MODEL_PATH} /path/to/self-test.png --work-dir work_dir --device cpu --
↪quant --quant-image-dir /path/to/imagenet-sample-images
...
```

Description

## 9.4 Custom calibration dataset

Calibration set is used to calculate quantization layer parameters. Some DFQ (Data Free Quantization) methods do not even require a dataset.

- Create a folder, just put in some images (no directory structure, no negative example, no special filename format)
- The image needs to be the data comes from real scenario otherwise the accuracy would be drop
- You can not quantize model with test dataset

Type	Train dataset	Validation dataset	Test dataset	Calibration dataset
Usage	QAT	PTQ	Test accuracy	PTQ

It is highly recommended that *verifying model precision* after quantization. *Here* is some quantization model test result.

## USEFUL TOOLS

Apart from `deploy.py`, there are other useful tools under the `tools/` directory.

### 10.1 torch2onnx

This tool can be used to convert PyTorch model from OpenMMLab to ONNX.

#### 10.1.1 Usage

```
python tools/torch2onnx.py \
    ${DEPLOY_CFG} \
    ${MODEL_CFG} \
    ${CHECKPOINT} \
    ${INPUT_IMG} \
    --work-dir ${WORK_DIR} \
    --device cpu \
    --log-level INFO
```

#### 10.1.2 Description of all arguments

- `deploy_cfg` : The path of the deploy config file in MMDeploy codebase.
- `model_cfg` : The path of model config file in OpenMMLab codebase.
- `checkpoint` : The path of the model checkpoint file.
- `img` : The path of the image file used to convert the model.
- `--work-dir` : Directory to save output ONNX models Default is `./work-dir`.
- `--device` : The device used for conversion. If not specified, it will be set to `cpu`.
- `--log-level` : To set log level which in 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. If not specified, it will be set to `INFO`.

## 10.2 extract

ONNX model with Mark nodes in it can be partitioned into multiple subgraphs. This tool can be used to extract the subgraph from the ONNX model.

### 10.2.1 Usage

```
python tools/extract.py \  
    ${INPUT_MODEL} \  
    ${OUTPUT_MODEL} \  
    --start ${PARTITION_START} \  
    --end ${PARTITION_END} \  
    --log-level INFO
```

### 10.2.2 Description of all arguments

- `input_model` : The path of input ONNX model. The output ONNX model will be extracted from this model.
- `output_model` : The path of output ONNX model.
- `--start` : The start point of extracted model with format `<function_name>:<input/output>`. The `function_name` comes from the decorator `@mark`.
- `--end` : The end point of extracted model with format `<function_name>:<input/output>`. The `function_name` comes from the decorator `@mark`.
- `--log-level` : To set log level which in 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. If not specified, it will be set to INFO.

### 10.2.3 Note

To support the model partition, you need to add Mark nodes in the ONNX model. The Mark node comes from the `@mark` decorator. For example, if we have marked the `multiclass_nms` as below, we can set `end=multiclass_nms:input` to extract the subgraph before NMS.

```
@mark('multiclass_nms', inputs=['boxes', 'scores'], outputs=['dets', 'labels'])  
def multiclass_nms(*args, **kwargs):  
    """Wrapper function for `_multiclass_nms`."""
```

## 10.3 onnx2pplnn

This tool helps to convert an ONNX model to an PPLNN model.

### 10.3.1 Usage

```
python tools/onnx2pplnn.py \
    ${ONNX_PATH} \
    ${OUTPUT_PATH} \
    --device cuda:0 \
    --opt-shapes [224,224] \
    --log-level INFO
```

### 10.3.2 Description of all arguments

- `onnx_path`: The path of the ONNX model to convert.
- `output_path`: The converted PPLNN algorithm path in json format.
- `device`: The device of the model during conversion.
- `opt-shapes`: Optimal shapes for PPLNN optimization. The shape of each tensor should be wrap with “[ ]” or “( )” and the shapes of tensors should be separated by “,”.
- `--log-level`: To set log level which in 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. If not specified, it will be set to INFO.

## 10.4 onnx2tensorrt

This tool can be used to convert ONNX to TensorRT engine.

### 10.4.1 Usage

```
python tools/onnx2tensorrt.py \
    ${DEPLOY_CFG} \
    ${ONNX_PATH} \
    ${OUTPUT} \
    --device-id 0 \
    --log-level INFO \
    --calib-file /path/to/file
```

### 10.4.2 Description of all arguments

- `deploy_cfg`: The path of the deploy config file in MMDeploy codebase.
- `onnx_path`: The ONNX model path to convert.
- `output`: The path of output TensorRT engine.
- `--device-id`: The device index, default to 0.
- `--calib-file`: The calibration data used to calibrate engine to int8.
- `--log-level`: To set log level which in 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. If not specified, it will be set to INFO.

## 10.5 onnx2ncnn

This tool helps to convert an ONNX model to an ncnn model.

### 10.5.1 Usage

```
python tools/onnx2ncnn.py \  
    ${ONNX_PATH} \  
    ${NCNN_PARAM} \  
    ${NCNN_BIN} \  
    --log-level INFO
```

### 10.5.2 Description of all arguments

- onnx\_path : The path of the ONNX model to convert from.
- output\_param : The converted ncnn param path.
- output\_bin : The converted ncnn bin path.
- --log-level : To set log level which in 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. If not specified, it will be set to INFO.

## 10.6 profiler

This tool helps to test latency of models with PyTorch, TensorRT and other backends. Note that the pre- and post-processing is excluded when computing inference latency.

### 10.6.1 Usage

```
python tools/profiler.py \  
    ${DEPLOY_CFG} \  
    ${MODEL_CFG} \  
    ${IMAGE_DIR} \  
    --model ${MODEL} \  
    --device ${DEVICE} \  
    --shape ${SHAPE} \  
    --num-iter ${NUM_ITER} \  
    --warmup ${WARMUP} \  
    --cfg-options ${CFG_OPTIONS} \  
    --batch-size ${BATCH_SIZE} \  
    --img-ext ${IMG_EXT}
```

## 10.6.2 Description of all arguments

- `deploy_cfg` : The path of the deploy config file in MMDeploy codebase.
- `model_cfg` : The path of model config file in OpenMMLab codebase.
- `image_dir` : The directory to image files that used to test the model.
- `--model` : The path of the model to be tested.
- `--shape` : Input shape of the model by HxW, e.g., 800x1344. If not specified, it would use `input_shape` from deploy config.
- `--num-iter` : Number of iteration to run inference. Default is 100.
- `--warmup` : Number of iteration to warm-up the machine. Default is 10.
- `--device` : The device type. If not specified, it will be set to `cuda:0`.
- `--cfg-options` : Optional key-value pairs to be overrode for model config.
- `--batch-size` : the batch size for test inference. Default is 1. Note that not all models support `batch_size>1`.
- `--img-ext` : the file extensions for input images from `image_dir`. Defaults to `['.jpg', '.jpeg', '.png', '.ppm', '.bmp', '.pgm', '.tif']`.

## 10.6.3 Example:

```
python tools/profiler.py \
  configs/mmccls/classification_tensorrt_dynamic-224x224-224x224.py \
  ../mmclassification/configs/resnet/resnet18_8xb32_in1k.py \
  ../mmclassification/demo/ \
  --model work-dirs/mmccls/resnet/trt/end2end.engine \
  --device cuda \
  --shape 224x224 \
  --num-iter 100 \
  --warmup 10 \
  --batch-size 1
```

And the output look like this:

```
----- Settings:
+-----+
| batch size |    1    |
|   shape   | 224x224 |
| iterations |   100   |
|  warmup   |    10   |
+-----+
----- Results:
+-----+-----+
| Stats | Latency/ms |   FPS   |
+-----+-----+
| Mean  |    1.535   | 651.656 |
| Median |    1.665   | 600.569 |
| Min   |    1.308   | 764.341 |
| Max   |    1.689   | 591.983 |
+-----+-----+
```

## SUPPORTED MODELS

The table below lists the models that are guaranteed to be exportable to other backends.

### 11.1 Note

- Tag:
  - static: This model only support static export. Please use static deploy config, just like `$MMDEPLOY_DIR/configs/mmdet/detection/detection_tensorrt_static-1024x2048.py`.
- SSD: When you convert SSD model, you need to use min shape deploy config just like `300x300-512x512` rather than `320x320-1344x1344`, for example `$MMDEPLOY_DIR/configs/mmdet/detection/detection_tensorrt_dynamic-300x300-512x512.py`.
- YOLOX: YOLOX with ncnn only supports static shape.
- Swin Transformer: For TensorRT, only version 8.4+ is supported.
- SAR: Chinese text recognition model is not supported as the protobuf size of ONNX is limited.

## BENCHMARK

### 12.1 Backends

CPU: ncnn, ONNXRuntime, OpenVINO

GPU: ncnn, TensorRT, PPLNN

### 12.2 Latency benchmark

#### 12.2.1 Platform

- Ubuntu 18.04
- ncnn 20211208
- Cuda 11.3
- TensorRT 7.2.3.4
- Docker 20.10.8
- NVIDIA tesla T4 tensor core GPU for TensorRT

#### 12.2.2 Other settings

- Static graph
- Batch size 1
- Synchronize devices after each inference.
- We count the average inference performance of 100 images of the dataset.
- Warm up. For ncnn, we warm up 30 iters for all codebases. As for other backends: for classification, we warm up 1010 iters; for other codebases, we warm up 10 iters.
- Input resolution varies for different datasets of different codebases. All inputs are real images except for `mediting` because the dataset is not large enough.

Users can directly test the speed through *model profiling*. And here is the benchmark in our environment.

## 12.3 Performance benchmark

Users can directly test the performance through [how\\_to\\_evaluate\\_a\\_model.md](#). And here is the benchmark in our environment.

- As some datasets contain images with various resolutions in codebase like MMDet. The speed benchmark is gained through static configs in MMDeploy, while the performance benchmark is gained through dynamic ones.
- Some int8 performance benchmarks of TensorRT require Nvidia cards with tensor core, or the performance would drop heavily.
- DBNet uses the interpolate mode `nearest` in the neck of the model, which TensorRT-7 applies a quite different strategy from Pytorch. To make the repository compatible with TensorRT-7, we rewrite the neck to use the interpolate mode `bilinear` which improves final detection performance. To get the matched performance with Pytorch, TensorRT-8+ is recommended, which the interpolate methods are all the same as Pytorch.
- Mask AP of Mask R-CNN drops by 1% for the backend. The main reason is that the predicted masks are directly interpolated to original image in PyTorch, while they are at first interpolated to the preprocessed input image of the model and then to original image in other backends.
- MMPose models are tested with `flip_test` explicitly set to `False` in model configs.
- Some models might get low accuracy in fp16 mode. Please adjust the model to avoid value overflow.

## TEST ON EMBEDDED DEVICE

Here are the test conclusions of our edge devices. You can directly obtain the results of your own environment with *model profiling*.

### 13.1 Software and hardware environment

- host OS ubuntu 18.04
- backend SNPE-1.59
- device Mi11 (qcom 888)

### 13.2 mmcls

tips:

1. The ImageNet-1k dataset is too large to test, only part of the dataset is used (8000/50000)
2. The heating of device will downgrade the frequency, so the time consumption will actually fluctuate. Here are the stable values after running for a period of time. This result is closer to the actual demand.

### 13.3 mmocr detection

### 13.4 mmpose

tips:

- Test pose\_hrnet using AnimalPose's test dataset instead of val dataset.

## 13.5 mmseg

tips:

- fcn works fine with 512x1024 size. Cityscapes dataset uses 1024x2048 resolution which causes device to reboot.

## 13.6 Notes

- We need to manually split the mmdet model into two parts. Because
  - In snpe source code, `onnx_to_ir.py` can only parse onnx input while `ir_to_dlc.py` does not support `topk` operator
  - UDO (User Defined Operator) does not work with `snpe-onnx-to-dlc`
- mmedit model
  - `srcnn` requires cubic resize which snpe does not support
  - `esrgan` converts fine, but loading the model causes the device to reboot
- mmrotate depends on `e2cnn` and needs to be installed manually [its Python3.6 compatible branch](#)

## TEST ON TVM

### 14.1 Supported Models

The table above list the models that we have tested. Models not listed on the table might still be able to converted. Please have a try.

### 14.2 Test

- Ubuntu 20.04
- tvn 0.9.0

\*: We only test model on ssd since dynamic shape is not supported for now.

## QUANTIZATION TEST RESULT

Currently mmdeploy support ncnn quantization

### 15.1 Quantize with ncnn

#### 15.1.1 mmcls

Note:

- Because of the large amount of imagenet-1k data and ncnn has not released Vulkan int8 version, only part of the test set (4000/50000) is used.
- The accuracy will vary after quantization, and it is normal for the classification model to increase by less than 1%.

#### 15.1.2 OCR detection

Note: `mmocr` Uses 'shapely' to compute IoU, which results in a slight difference in accuracy

#### 15.1.3 Pose detection

Note: MMPose models are tested with `flip_test` explicitly set to `False` in model configs.

## MMCLASSIFICATION DEPLOYMENT

- MMSegmentation Deployment
  - *Installation*
    - \* *Install mmcls*
    - \* *Install mmdeploy*
  - *Convert model*
  - *Model Specification*
  - *Model inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
  - *Supported models*

---

MMClassification aka `mmcls` is an open-source image classification toolbox based on PyTorch. It is a part of the OpenMMLab project.

### 16.1 Installation

#### 16.1.1 Install mmcls

Please follow this [quick guide](#) to install mmcls.

#### 16.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on 1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run [scripts](#). For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdploy.git
cd mmdploy
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdploy-dep/onnxruntime-linux-x64-1.8.1/lib/:$LD_
↳LIBRARY_PATH
```

### Method III: Build from source

If neither **I** nor **II** meets your requirements, *building mmdploy from source* is the last option.

## 16.2 Convert model

You can use `tools/deploy.py` to convert mmcls models to the specified backend models. Its detailed usage can be learned from [here](#).

The command below shows an example about converting `resnet18` model to onnx model that can be inferred by ONNX Runtime.

```
cd mmdploy

# download resnet18 model from mmcls model zoo
mim download mmcls --config resnet18_8xb32_in1k --dest .

# convert mmcls model to onnxruntime model with dynamic shape
python tools/deploy.py \
    configs/mmcls/classification_onnxruntime_dynamic.py \
    resnet18_8xb32_in1k.py \
    resnet18_8xb32_in1k_20210831-fbbb1da6.pth \
    tests/data/tiger.jpeg \
    --work-dir mmdploy_models/mmcls/ort \
    --device cpu \
    --show \
    --dump-info
```

It is crucial to specify the correct deployment config during model conversion. We've already provided builtin deployment config [files](#) of all supported backends for mmclassification. The config filename pattern is:

```
classification_{backend}-{precision}-{static | dynamic}_{shape}.py
```

- **{backend}**: inference backend, such as onnxruntime, tensorrt, pplnn, ncnn, openvino, coreml and etc.
- **{precision}**: fp16, int8. When it's empty, it means fp32
- **{static | dynamic}**: static shape or dynamic shape
- **{shape}**: input shape or shape range of a model

Therefore, in the above example, you can also convert `resnet18` to other backend models by changing the deployment config file `classification_onnxruntime_dynamic.py` to [others](#), e.g., converting to `tensorrt-fp16` model by `classification_tensorrt-fp16_dynamic-224x224-224x224.py`.

---

**Tip:** When converting mmcls models to tensorrt models, `-device` should be set to “cuda”

---

## 16.3 Model Specification

Before moving on to model inference chapter, let's know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmccls/ort` in the previous example. It includes:

```
mmdeploy_models/mmccls/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmccls/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 16.4 Model inference

### 16.4.1 Backend model inference

Take the previous converted `end2end.onnx` model as an example, you can use the following code to inference the model.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmccls/classification_onnxruntime_dynamic.py'
model_cfg = './resnet18_8xb32_in1k.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmccls/ort/end2end.onnx']
image = 'tests/data/tiger.jpeg'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
```

(continues on next page)

(continued from previous page)

```
result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='output_classification.png')
```

## 16.4.2 SDK model inference

You can also perform SDK model inference like following,

```
from mmdeploy_python import Classifier
import cv2

img = cv2.imread('tests/data/tiger.jpeg')

# create a classifier
classifier = Classifier(model_path='./mmdeploy_models/mmcls/ort', device_name='cpu',
    ↪device_id=0)
# perform inference
result = classifier(img)
# show inference result
for label_id, score in result:
    print(label_id, score)
```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

## 16.5 Supported models

## MMDETECTION DEPLOYMENT

- *MMDetection Deployment*
  - *Installation*
    - \* *Install mmdet*
    - \* *Install mmdeploy*
  - *Convert model*
  - *Model specification*
  - *Model inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
  - *Supported models*

---

**MMDetection** aka **mmdet** is an open source object detection toolbox based on PyTorch. It is a part of the **OpenMMLab** project.

### 17.1 Installation

#### 17.1.1 Install mmdet

Please follow the [installation guide](#) to install mmdet.

#### 17.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on 1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run *scripts*. For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdet.git
cd mmdet
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdet-dep/onnxmlruntime-linux-x64-1.8.1/lib:$LD_
  ↳LIBRARY_PATH
```

### Method III: Build from source

If neither **I** nor **II** meets your requirements, *building mmdet from source* is the last option.

## 17.2 Convert model

You can use `tools/deploy.py` to convert mmdet models to the specified backend models. Its detailed usage can be learned from [here](#).

The command below shows an example about converting Faster R-CNN model to onnx model that can be inferred by ONNX Runtime.

```
cd mmdet
# download faster r-cnn model from mmdet model zoo
mim download mmdet --config faster-rcnn_r50_fpn_1x_coco --dest .
# convert mmdet model to onnxruntime model with dynamic shape
python tools/deploy.py \
  configs/mmdet/detection/detection_onnxruntime_dynamic.py \
  faster-rcnn_r50_fpn_1x_coco.py \
  faster_rcnn_r50_fpn_1x_coco_20200130-047c8118.pth \
  demo/resources/det.jpg \
  --work-dir mmdet_models/mmdet/ort \
  --device cpu \
  --show \
  --dump-info
```

It is crucial to specify the correct deployment config during model conversion. We've already provided builtin deployment config files of all supported backends for mmdetection, under which the config file path follows the pattern:

```
{task}/{task}_{backend}-{precision}_{static | dynamic}_{shape}.py
```

- **{task}**: task in mmdetection.

There are two of them. One is `detection` and the other is `instance-seg`, indicating instance segmentation.

mmdet models like RetinaNet, Faster R-CNN and DETR and so on belongs to `detection` task. While Mask R-CNN is one of `instance-seg` models. You can find more of them in chapter [Supported models](#).

**DO REMEMBER TO USE** `detection/detection_*.py` deployment config file when trying to convert detection models and use `instance-seg/instance-seg_*.py` to deploy instance segmentation models.

- **{backend}**: inference backend, such as `onnxruntime`, `tensorrt`, `pplnn`, `ncnn`, `openvino`, `coreml` etc.
- **{precision}**: `fp16`, `int8`. When it's empty, it means `fp32`
- **{static | dynamic}**: static shape or dynamic shape
- **{shape}**: input shape or shape range of a model

Therefore, in the above example, you can also convert faster r-cnn to other backend models by changing the deployment config file `detection_onnxruntime_dynamic.py` to [others](#), e.g., converting to tensorrt-fp16 model by `detection_tensorrt-fp16_dynamic-320x320-1344x1344.py`.

---

**Tip:** When converting mmdet models to tensorrt models, `-device` should be set to “cuda”

---

## 17.3 Model specification

Before moving on to model inference chapter, let's know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmdet/ort` in the previous example. It includes:

```
mmdeploy_models/mmdet/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmdet/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 17.4 Model inference

### 17.4.1 Backend model inference

Take the previous converted `end2end.onnx` model as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmdet/detection/detection_onnxruntime_dynamic.py'
model_cfg = './faster-rcnn_r50_fpn_1x_coco.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmdet/ort/end2end.onnx']
image = './demo/resources/det.jpg'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
```

(continues on next page)

(continued from previous page)

```
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
    result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='output_detection.png')
```

## 17.4.2 SDK model inference

You can also perform SDK model inference like following,

```
from mmdeploy_python import Detector
import cv2

img = cv2.imread('./demo/resources/det.jpg')

# create a detector
detector = Detector(model_path='./mmdeploy_models/mmdet/ort', device_name='cpu', device_id=0)

# perform inference
bboxes, labels, masks = detector(img)

# visualize inference result
indices = [i for i in range(len(bboxes))]
for index, bbox, label_id in zip(indices, bboxes, labels):
    [left, top, right, bottom], score = bbox[0:4].astype(int), bbox[4]
    if score < 0.3:
        continue

    cv2.rectangle(img, (left, top), (right, bottom), (0, 255, 0))

cv2.imwrite('output_detection.png', img)
```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

## 17.5 Supported models

## MMSEGMENTATION DEPLOYMENT

- *MMSegmentation Deployment*
  - *Installation*
    - \* *Install mmseg*
    - \* *Install mmdeploy*
  - *Convert model*
  - *Model specification*
  - *Model inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
  - *Supported models*
  - *Reminder*

---

`MMSegmentation` aka `mmseg` is an open source semantic segmentation toolbox based on PyTorch. It is a part of the OpenMMLab project.

### 18.1 Installation

#### 18.1.1 Install mmseg

Please follow the [installation guide](#) to install mmseg.

#### 18.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on 1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run *scripts*. For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdploy.git
cd mmdploy
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdploy-dep/onnxruntime-linux-x64-1.8.1/lib/:$LD_
↳LIBRARY_PATH
```

**NOTE:**

- Adding \$(pwd)/build/lib to PYTHONPATH is for importing mmdploy SDK python module - mmdploy\_python, which will be presented in chapter *SDK model inference*.
- When *inference onnx model by ONNX Runtime*, it requests ONNX Runtime library be found. Thus, we add it to LD\_LIBRARY\_PATH.

**Method III: Build from source**

If neither **I** nor **II** meets your requirements, *building mmdploy from source* is the last option.

## 18.2 Convert model

You can use `tools/deploy.py` to convert mmseg models to the specified backend models. Its detailed usage can be learned from [here](#).

The command below shows an example about converting unet model to onnx model that can be inferred by ONNX Runtime.

```
cd mmdploy

# download unet model from mmseg model zoo
mim download mmsegmentation --config unet-s5-d16_fcn_4xb4-160k_cityscapes-512x1024 --
↳dest .

# convert mmseg model to onnxruntime model with dynamic shape
python tools/deploy.py \
    configs/mmseg/segmentation_onnxruntime_dynamic.py \
    unet-s5-d16_fcn_4xb4-160k_cityscapes-512x1024.py \
    fcn_unet_s5-d16_4x4_512x1024_160k_cityscapes_20211210_145204-6860854e.pth \
    demo/resources/cityscapes.png \
    --work-dir mmdploy_models/mmseg/ort \
    --device cpu \
    --show \
    --dump-info
```

It is crucial to specify the correct deployment config during model conversion. We've already provided builtin deployment config [files](#) of all supported backends for mmsegmentation. The config filename pattern is:

```
segmentation_{backend}-{precision}_{static | dynamic}_{shape}.py
```

- **{backend}**: inference backend, such as onnxruntime, tensorrt, pplnn, ncnn, openvino, coreml etc.
- **{precision}**: fp16, int8. When it's empty, it means fp32
- **{static | dynamic}**: static shape or dynamic shape
- **{shape}**: input shape or shape range of a model

Therefore, in the above example, you can also convert unet to other backend models by changing the deployment config file `segmentation_onnxruntime_dynamic.py` to `others`, e.g., converting to tensorrt-fp16 model by `segmentation_tensorrt-fp16_dynamic-512x1024-2048x2048.py`.

**Tip:** When converting mmseg models to tensorrt models, `-device` should be set to “cuda”

## 18.3 Model specification

Before moving on to model inference chapter, let’s know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmseg/ort` in the previous example. It includes:

```
mmdeploy_models/mmseg/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmseg/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 18.4 Model inference

### 18.4.1 Backend model inference

Take the previous converted `end2end.onnx` model as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmseg/segmentation_onnxruntime_dynamic.py'
model_cfg = './unet-s5-d16_fcn_4xb4-160k_cityscapes-512x1024.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmseg/ort/end2end.onnx']
image = './demo/resources/cityscapes.png'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
```

(continues on next page)

(continued from previous page)

```

task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
    result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='./output_segmentation.png')

```

## 18.4.2 SDK model inference

You can also perform SDK model inference like following.

```

from mmdeploy_python import Segmentor
import cv2
import numpy as np

img = cv2.imread('./demo/resources/cityscapes.png')

# create a classifier
segmentor = Segmentor(model_path='./mmdeploy_models/mmseg/ort', device_name='cpu',
    ↪device_id=0)
# perform inference
seg = segmentor(img)

# visualize inference result
## random a palette with size 256x3
palette = np.random.randint(0, 256, size=(256, 3))
color_seg = np.zeros((seg.shape[0], seg.shape[1], 3), dtype=np.uint8)
for label, color in enumerate(palette):
    color_seg[seg == label, :] = color
# convert to BGR
color_seg = color_seg[..., ::-1]
img = img * 0.5 + color_seg * 0.5
img = img.astype(np.uint8)
cv2.imwrite('output_segmentation.png', img)

```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

## 18.5 Supported models

### 18.6 Reminder

- Only `whole` inference mode is supported for all mmseg models.
- PSPNet, Fast-SCNN only support static shape, because `nn.AdaptiveAvgPool2d` is not supported by most inference backends.
- For models that only supports static shape, you should use the deployment config file of static shape such as `configs/mmseg/segmentation_tensorrt_static-1024x2048.py`.

## MMEDITING DEPLOYMENT

- *Installation*
  - *Install mmedit*
  - *Install mmdeploy*
- *Convert model*
  - *Convert super resolution model*
- *Model specification*
- *Model inference*
  - *Backend model inference*
  - *SDK model inference*
- *Supported models*

---

MMEditing aka `mmedit` is an open-source image and video editing toolbox based on PyTorch. It is a part of the OpenMMLab project.

### 19.1 Installation

#### 19.1.1 Install mmedit

Please follow the [installation guide](#) to install mmedit.

#### 19.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on 1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run [scripts](#). For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdploy.git
cd mmdploy
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdploy-dep/onnxruntime-linux-x64-1.8.1/lib:$LD_
↳LIBRARY_PATH
```

### Method III: Build from source

If neither **I** nor **II** meets your requirements, *building mmdeploy from source* is the last option.

## 19.2 Convert model

You can use `tools/deploy.py` to convert mmedit models to the specified backend models. Its detailed usage can be learned from [here](#).

When using `tools/deploy.py`, it is crucial to specify the correct deployment config. We've already provided builtin deployment config files of all supported backends for mmedit, under which the config file path follows the pattern:

```
{task}/{task}_{backend}-{precision}_{static | dynamic}_{shape}.py
```

- **{task}**: task in mmedit.

MMDeploy supports models of one task in mmedit, i.e., `super_resolution`. Please refer to chapter [supported models](#) for task-model organization.

**DO REMEMBER TO USE** the corresponding deployment config file when trying to convert models of different tasks.

- **{backend}**: inference backend, such as `onnxruntime`, `tensorrt`, `pplnn`, `ncnn`, `openvino`, `coreml` etc.
- **{precision}**: `fp16`, `int8`. When it's empty, it means `fp32`
- **{static | dynamic}**: `static` shape or `dynamic` shape
- **{shape}**: input shape or shape range of a model

### 19.2.1 Convert super resolution model

The command below shows an example about converting ESRGAN model to onnx model that can be inferred by ONNX Runtime.

```
cd mmdploy
# download esrgan model from mmedit model zoo
mim download mmedit --config esrgan_psnr-x4c64b23g32_1xb16-1000k_div2k --dest .
# convert esrgan model to onnxruntime model with dynamic shape
python tools/deploy.py \
  configs/mmedit/super-resolution/super-resolution-onnxruntime-dynamic.py \
  esrgan_psnr-x4c64b23g32_1xb16-1000k_div2k.py \
  esrgan_psnr-x4c64b23g32_1x16_1000k_div2k_20200420-bf5c993c.pth \
  demo/resources/face.png \
  --work-dir mmdploy_models/mmedit/ort \
  --device cpu \
  --show \
  --dump-info
```

You can also convert the above model to other backend models by changing the deployment config file `*_onnxruntime_dynamic.py` to `others`, e.g., converting to tensorrt model by `super-resolution/super-resolution_tensorrt_dynamic-32x32-512x512.py`.

**Tip:** When converting mmedit models to tensorrt models, `--device` should be set to “cuda”

## 19.3 Model specification

Before moving on to model inference chapter, let’s know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmedit/ort` in the previous example. It includes:

```
mmdeploy_models/mmedit/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmedit/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 19.4 Model inference

### 19.4.1 Backend model inference

Take the previous converted `end2end.onnx` model as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmedit/super-resolution/super-resolution_onnxruntime_dynamic.py'
model_cfg = 'esrgan_psnr-x4c64b23g32_1xb16-1000k_div2k.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmedit/ort/end2end.onnx']
image = './demo/resources/face.png'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
```

(continues on next page)

(continued from previous page)

```
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
    result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='output_restorer.bmp')
```

## 19.4.2 SDK model inference

You can also perform SDK model inference like following,

```
from mmdeploy_python import Restorer
import cv2

img = cv2.imread('./demo/resources/face.png')

# create a classifier
restorer = Restorer(model_path='./mmdeploy_models/mmedit/ort', device_name='cpu', device_
    id=0)
# perform inference
result = restorer(img)

# visualize inference result
# convert to BGR
result = result[..., ::-1]
cv2.imwrite('output_restorer.bmp', result)
```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

## 19.5 Supported models

## MMOCR DEPLOYMENT

- *MMOCR Deployment*
  - *Installation*
    - \* *Install mmocr*
    - \* *Install mmdploy*
  - *Convert model*
    - \* *Convert text detection model*
    - \* *Convert text recognition model*
  - *Model specification*
  - *Model Inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
      - *Text detection SDK model inference*
      - *Text Recognition SDK model inference*
  - *Supported models*
  - *Reminder*

---

MMOCR aka `mmocr` is an open-source toolbox based on PyTorch and mmdetection for text detection, text recognition, and the corresponding downstream tasks including key information extraction. It is a part of the [OpenMMLab](#) project.

## 20.1 Installation

### 20.1.1 Install mmocr

Please follow the [installation guide](#) to install mmocr.

### 20.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on 1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run *scripts*. For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdelay.git
cd mmdelay
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdelay-dep/onnxruntime-linux-x64-1.8.1/lib:$LD_
↳LIBRARY_PATH
```

**Method III:** Build from source

If neither **I** nor **II** meets your requirements, *building mmdeploy from source* is the last option.

## 20.2 Convert model

You can use `tools/deploy.py` to convert mmocr models to the specified backend models. Its detailed usage can be learned from [here](#).

When using `tools/deploy.py`, it is crucial to specify the correct deployment config. We've already provided builtin deployment config `files` of all supported backends for mmocr, under which the config file path follows the pattern:

```
{task}/{task}_{backend}-{precision}_{static | dynamic}_{shape}.py
```

- **{task}**: task in mmocr.

MMDeploy supports models of two tasks of mmocr, one is `text detection` and the other is `text-recognition`.

**DO REMEMBER TO USE** the corresponding deployment config file when trying to convert models of different tasks.

- **{backend}**: inference backend, such as `onnxruntime`, `tensorrt`, `pplnn`, `ncnn`, `openvino`, `coreml` etc.
- **{precision}**: `fp16`, `int8`. When it's empty, it means `fp32`
- **{static | dynamic}**: `static shape` or `dynamic shape`
- **{shape}**: `input shape` or `shape range of a model`

In the next two chapters, we will task `dbnet` model from `text detection` task and `crnn` model from `text recognition` task respectively as examples, showing how to convert them to `onnx` model that can be inferred by `ONNX Runtime`.

### 20.2.1 Convert text detection model

```
cd mmdeploy
# download dbnet model from mmocr model zoo
mim download mmocr --config dbnet_resnet18_fpnc_1200e_icdar2015 --dest .
# convert mmocr model to onnxruntime model with dynamic shape
python tools/deploy.py \
    configs/mmocr/text-detection/text-detection_onnxruntime_dynamic.py \
    dbnet_resnet18_fpnc_1200e_icdar2015.py \
    dbnet_resnet18_fpnc_1200e_icdar2015_20220825_221614-7c0e94f2.pth \
    demo/resources/text_det.jpg \
    --work-dir mmdeploy_models/mmocr/dbnet/ort \
    --device cpu \
    --show \
    --dump-info
```

### 20.2.2 Convert text recognition model

```
cd mmdeploy
# download crnn model from mmocr model zoo
mim download mmocr --config crnn_mini-vgg_5e_mj --dest .
# convert mmocr model to onnxruntime model with dynamic shape
python tools/deploy.py \
    configs/mmocr/text-recognition/text-recognition_onnxruntime_dynamic.py \
    crnn_mini-vgg_5e_mj.py \
    crnn_mini-vgg_5e_mj_20220826_224120-8afbedbb.pth \
    demo/resources/text_recog.jpg \
    --work-dir mmdeploy_models/mmocr/crnn/ort \
    --device cpu \
    --show \
    --dump-info
```

You can also convert the above models to other backend models by changing the deployment config file `*_onnxruntime_dynamic.py` to `others`, e.g., converting dbnet to tensorrt-fp32 model by `text-detection/text-detection_tensorrt-_dynamic-320x320-2240x2240.py`.

---

**Tip:** When converting mmocr models to tensorrt models, `--device` should be set to “cuda”

---

## 20.3 Model specification

Before moving on to model inference chapter, let's know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmocr/dbnet/ort` in the previous example. It includes:

```
mmdeploy_models/mmocr/dbnet/ort
├── deploy.json
├── detail.json
```

(continues on next page)

(continued from previous page)

```
└─ end2end.onnx
└─ pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package **mmdeploy\_models/mmcocr/dbnet/ort** is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 20.4 Model Inference

### 20.4.1 Backend model inference

Take the previous converted `end2end.onnx` mode of `dbnet` as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmcocr/text-detection/text-detection_onnxruntime_dynamic.py'
model_cfg = 'dbnet_resnet18_fpnc_1200e_icdar2015.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmcocr/dbnet/ort/end2end.onnx']
image = './demo/resources/text_det.jpg'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
    result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='output_ocr.png')
```

**Tip:**

Map 'deploy\_cfg', 'model\_cfg', 'backend\_model' and 'image' to corresponding arguments in chapter *convert text recognition model*, you will get the ONNX Runtime inference results of crnn onnx model.

## 20.4.2 SDK model inference

Given the above SDK models of dbnet and crnn, you can also perform SDK model inference like following,

### Text detection SDK model inference

```
import cv2
from mmdeploy_python import TextDetector

img = cv2.imread('demo/resources/text_det.jpg')
# create text detector
detector = TextDetector(
    model_path='mmdeploy_models/mmodcr/dbnet/ort',
    device_name='cpu',
    device_id=0)
# do model inference
bboxes = detector(img)
# draw detected bbox into the input image
if len(bboxes) > 0:
    pts = ((bboxes[:, 0:8] + 0.5).reshape(len(bboxes), -1,
                                         2).astype(int))
    cv2.polylines(img, pts, True, (0, 255, 0), 2)
    cv2.imwrite('output_ocr.png', img)
```

### Text Recognition SDK model inference

```
import cv2
from mmdeploy_python import TextRecognizer

img = cv2.imread('demo/resources/text_recog.jpg')
# create text recognizer
recognizer = TextRecognizer(
    model_path='mmdeploy_models/mmodcr/crnn/ort',
    device_name='cpu',
    device_id=0)
# do model inference
texts = recognizer(img)
# print the result
print(texts)
```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

## 20.5 Supported models

## 20.6 Reminder

- ABINet for TensorRT require pytorch1.10+ and TensorRT 8.4+.
- For TensorRT backend, users have to choose the right config. For example, CRNN only accepts 1 channel input. Here is a recommendation table:

## MMPOSE DEPLOYMENT

- *MMPose Deployment*
  - *Installation*
    - \* *Install mmpose*
    - \* *Install mmdeploy*
  - *Convert model*
  - *Model specification*
  - *Model inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
  - *Supported models*

---

**MMPose** aka **mmpose** is an open-source toolbox for pose estimation based on PyTorch. It is a part of the **OpenMMLab** project.

### 21.1 Installation

#### 21.1.1 Install mmpose

Please follow the [best practice](#) to install mmpose.

#### 21.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on 1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run [scripts](#). For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdet.git
cd mmdet
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdet-dep/onnxruntime-linux-x64-1.8.1/lib:$LD_
↳LIBRARY_PATH
```

### Method III: Build from source

If neither **I** nor **II** meets your requirements, *building mmdet from source* is the last option.

## 21.2 Convert model

You can use `tools/deploy.py` to convert mmpose models to the specified backend models. Its detailed usage can be learned from [here](#).

The command below shows an example about converting hrnet model to onnx model that can be inferred by ONNX Runtime.

```
cd mmdet
# download hrnet model from mmpose model zoo
mim download mmpose --config td-hm_hrnet-w32_8xb64-210e_coco-256x192 --dest .
# convert mmdet model to onnxruntime model with static shape
python tools/deploy.py \
    configs/mmpose/pose-detection_onnxruntime_static.py \
    td-hm_hrnet-w32_8xb64-210e_coco-256x192.py \
    hrnet_w32_coco_256x192-c78dce93_20200708.pth \
    demo/resources/human-pose.jpg \
    --work-dir mmdet_models/mmpose/ort \
    --device cpu \
    --show
```

It is crucial to specify the correct deployment config during model conversion. We've already provided builtin deployment config [files](#) of all supported backends for mmpose. The config filename pattern is:

```
pose-detection_{backend}-{precision}-{static | dynamic}_{shape}.py
```

- **{backend}**: inference backend, such as onnxruntime, tensorrt, pplnn, ncnn, openvino, coreml etc.
- **{precision}**: fp16, int8. When it's empty, it means fp32
- **{static | dynamic}**: static shape or dynamic shape
- **{shape}**: input shape or shape range of a model

Therefore, in the above example, you can also convert hrnet to other backend models by changing the deployment config file `pose-detection_onnxruntime_static.py` to [others](#), e.g., converting to tensorrt model by `pose-detection_tensorrt_static-256x192.py`.

---

**Tip:** When converting mmpose models to tensorrt models, `--device` should be set to “cuda”

---

## 21.3 Model specification

Before moving on to model inference chapter, let's know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmpose/ort` in the previous example. It includes:

```
mmdeploy_models/mmpose/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmpose/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 21.4 Model inference

### 21.4.1 Backend model inference

Take the previous converted `end2end.onnx` model as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmpose/pose-detection_onnxruntime_static.py'
model_cfg = 'td-hm_hrnet-w32_8xb64-210e_coco-256x192.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmpose/ort/end2end.onnx']
image = './demo/resources/human-pose.jpg'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
```

(continues on next page)

(continued from previous page)

```
result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='output_pose.png')
```

### 21.4.2 SDK model inference

TODO

## 21.5 Supported models

## MMDetection3D DEPLOYMENT

- *Install mmdet3d*
  - *Convert model*
  - *Model inference*
  - *Supported models*
- 

MMDetection3d aka mmdet3d is an open source object detection toolbox based on PyTorch, towards the next-generation platform for general 3D detection. It is a part of the [OpenMMLab](#) project.

### 22.1 Install mmdet3d

These branches are required for mmdet3d deployment

First checkout and install mmcv/mmdet/mmseg/mmdet3d

```
python3 -m pip install openmim --user
python3 -m mim install mmcv==2.0.0rc1 mmdet==3.0.0rc1 mmseg==1.0.0rc0 --user

git clone https://github.com/open-mmlab/mmdetection3d --branch v1.1.0rc1
cd mmdetection3d
python3 -m pip install .
cd -
```

After installation, tools/check\_env.py should display mmdet3d version normally

```
python3 tools/check_env.py
..
11/11 13:56:19 - mmengine - INFO - *****Codebase information*****
11/11 13:56:19 - mmengine - INFO - mmdet:      3.0.0rc1
11/11 13:56:19 - mmengine - INFO - mmseg:      1.0.0rc0
..
11/11 13:56:19 - mmengine - INFO - mmdet3d:    1.1.0rc1
```

## 22.2 Convert model

For example, use `tools/deploy.py` to convert centerpoint to onnxruntime format

```
export MODEL_CONFIG=/path/to/mmdetection3d/configs/centerpoint/centerpoint_pillar02_
↪second_secfpn_head-circlenms_8xb4-cyclic-20e_nus-3d.py

export MODEL_PATH=https://download.openmmlab.com/mmdetection3d/v1.0.0_models/centerpoint/
↪centerpoint_02pillar_second_secfpn_circlenms_4x8_cyclic_20e_nus/centerpoint_02pillar_
↪second_secfpn_circlenms_4x8_cyclic_20e_nus_20210816_064624-0f3299c0.pth

export TEST_DATA=/path/to/mmdetection3d/tests/data/nuscenes/sweeps/LIDAR_TOP/n008-2018-
↪09-18-12-07-26-0400__LIDAR_TOP__1537287083900561.pcd.bin

python3 tools/deploy.py configs/mmdet3d/voxel-detection/voxel-detection_onnxruntime_
↪dynamic.py $MODEL_CONFIG $MODEL_PATH $TEST_DATA --work-dir centerpoint
```

This step would generate `end2end.onnx` in `work-dir`

```
ls -lah centerpoint
..
-rw-rw-r-- 1 rg rg 87M 11 4 19:48 end2end.onnx
```

## 22.3 Model inference

At present, the voxelize preprocessing and postprocessing of `mmdet3d` are not converted into onnx operations; the C++ SDK has not yet implemented the voxelize calculation.

The caller needs to refer to the corresponding python implementation to complete.

## 22.4 Supported models

- Make sure `trt`  $\geq 8.4$  for some bug fixed, such as `ScatterND`, dynamic shape crash and so on.

## MMROTATE DEPLOYMENT

- *MMRotate Deployment*
  - *Installation*
    - \* *Install mmrotate*
    - \* *Install mmdeploy*
  - *Convert model*
  - *Model specification*
  - *Model inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
  - *Supported models*

---

**MMRotate** is an open-source toolbox for rotated object detection based on PyTorch. It is a part of the [OpenMMLab](#) project.

## 23.1 Installation

### 23.1.1 Install mmrotate

Please follow the [installation guide](#) to install mmrotate.

### 23.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I:** Install precompiled package

**TODO.** MMDeploy hasn't released based on dev-1.x branch.

**Method II:** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run *scripts*. For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b dev-1.x https://github.com/open-mmlab/mmdploy.git
cd mmdploy
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdploy-dep/onnxruntime-linux-x64-1.8.1/lib/:$LD_
↳LIBRARY_PATH
```

**NOTE:**

- Adding \$(pwd)/build/lib to PYTHONPATH is for importing mmdploy SDK python module - mmdploy\_python, which will be presented in chapter *SDK model inference*.
- When *inference onnx model by ONNX Runtime*, it requests ONNX Runtime library be found. Thus, we add it to LD\_LIBRARY\_PATH.

**Method III: Build from source**

If neither **I** nor **II** meets your requirements, *building mmdploy from source* is the last option.

## 23.2 Convert model

You can use `tools/deploy.py` to convert mmrotate models to the specified backend models. Its detailed usage can be learned from [here](#).

The command below shows an example about converting rotated-faster-rcnn model to onnx model that can be inferred by ONNX Runtime.

```
cd mmdploy

# download rotated-faster-rcnn model from mmrotate model zoo
mim download mmrotate --config rotated-faster-rcnn-le90_r50_fpn_1x_dota --dest .
wget https://github.com/open-mmlab/mmrrotate/raw/main/demo/dota_demo.jpg

# convert mmrotate model to onnxruntime model with dynamic shape
python tools/deploy.py \
    configs/mmrrotate/rotated-detection_onnxruntime_dynamic.py \
    rotated-faster-rcnn-le90_r50_fpn_1x_dota.py \
    rotated_faster_rcnn_r50_fpn_1x_dota_le90-0393aa5c.pth \
    dota_demo.jpg \
    --work-dir mmdploy_models/mmrrotate/ort \
    --device cpu \
    --show \
    --dump-info
```

It is crucial to specify the correct deployment config during model conversion. We've already provided builtin deployment config files of all supported backends for mmrotate. The config filename pattern is:

```
rotated_detection-{backend}-{precision}_{static | dynamic}_{shape}.py
```

- **{backend}**: inference backend, such as onnxruntime, tensorrt, pplnn, ncnn, openvino, coreml etc.
- **{precision}**: fp16, int8. When it's empty, it means fp32
- **{static | dynamic}**: static shape or dynamic shape
- **{shape}**: input shape or shape range of a model

Therefore, in the above example, you can also convert `rotated-faster-rcnn` to other backend models by changing the deployment config file `rotated-detection_onnxruntime_dynamic` to `others`, e.g., converting to `tensorrt-fp16` model by `rotated-detection_tensorrt-fp16_dynamic-320x320-1024x1024.py`.

**Tip:** When converting mmrotate models to tensorrt models, `-device` should be set to “cuda”

## 23.3 Model specification

Before moving on to model inference chapter, let’s know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmrotate/ort` in the previous example. It includes:

```
mmdeploy_models/mmrotate/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmrotate/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 23.4 Model inference

### 23.4.1 Backend model inference

Take the previous converted `end2end.onnx` model as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import torch

deploy_cfg = 'configs/mmrotate/rotated-detection_onnxruntime_dynamic.py'
model_cfg = './rotated-faster-rcnn-le90_r50_fpn_1x_dota.py'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmrotate/ort/end2end.onnx']
image = './dota_demo.jpg'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)

# build task and backend model
```

(continues on next page)

(continued from previous page)

```
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
    result = model.test_step(model_inputs)

# visualize results
task_processor.visualize(
    image=image,
    model=model,
    result=result[0],
    window_name='visualize',
    output_file='./output.png')
```

### 23.4.2 SDK model inference

You can also perform SDK model inference like following,

```
from mmdeploy_python import RotatedDetector
import cv2
import numpy as np

img = cv2.imread('./dota_demo.jpg')

# create a detector
detector = RotatedDetector(model_path='./mmdeploy_models/mmrotate/ort', device_name='cpu
↪', device_id=0)
# perform inference
det = detector(img)
```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

## 23.5 Supported models

## MMACTION2 DEPLOYMENT

- *MMAction2 Deployment*
  - *Installation*
    - \* *Install mmaction2*
    - \* *Install mmdeploy*
  - *Convert model*
    - \* *Convert video recognition model*
  - *Model specification*
  - *Model Inference*
    - \* *Backend model inference*
    - \* *SDK model inference*
      - *Video recognition SDK model inference*
  - *Supported models*

---

MMAction2 is an open-source toolbox for video understanding based on PyTorch. It is a part of the [OpenMMLab](#) project.

## 24.1 Installation

### 24.1.1 Install mmaction2

Please follow the [installation guide](#) to install mmaction2.

### 24.1.2 Install mmdeploy

There are several methods to install mmdeploy, among which you can choose an appropriate one according to your target platform and device.

**Method I** Install precompiled package

You can download the latest release package from [here](#)

**Method II** Build using scripts

If your target platform is **Ubuntu 18.04 or later version**, we encourage you to run *scripts*. For example, the following commands install mmdeploy as well as inference engine - ONNX Runtime.

```
git clone --recursive -b 1.x https://github.com/open-mmlab/mmdploy.git
cd mmdploy
python3 tools/scripts/build_ubuntu_x64_ort.py $(nproc)
export PYTHONPATH=$(pwd)/build/lib:$PYTHONPATH
export LD_LIBRARY_PATH=$(pwd)/../mmdploy-dep/onnxruntime-linux-x64-1.8.1/lib:$LD_
↪LIBRARY_PATH
```

### Method III: Build from source

If neither **I** nor **II** meets your requirements, *building mmdeploy from source* is the last option.

## 24.2 Convert model

You can use `tools/deploy.py` to convert mmaction2 models to the specified backend models. Its detailed usage can be learned from [here](#).

When using `tools/deploy.py`, it is crucial to specify the correct deployment config. We've already provided builtin deployment config files of all supported backends for mmaction2, under which the config file path follows the pattern:

```
{task}/{task}_{backend}-{precision}_{static | dynamic}_{shape}.py
```

- **{task}**: task in mmaction2.
- **{backend}**: inference backend, such as onnxruntime, tensorrt, pplnn, ncnn, openvino, coreml etc.
- **{precision}**: fp16, int8. When it's empty, it means fp32
- **{static | dynamic}**: static shape or dynamic shape
- **{shape}**: input shape or shape range of a model
- **{2d/3d}**: model type

In the next part we will take `tsn` model from `video_recognition` task as an example, showing how to convert them to onnx model that can be inferred by ONNX Runtime.

### 24.2.1 Convert video recognition model

```
cd mmdploy

# download tsn model from mmaction2 model zoo
mim download mmaction2 --config tsn_imagenet-pretrained-r50_8xb32-1x1x3-100e_kinetics400-
↪rgb --dest .

# convert mmaction2 model to onnxruntime model with dynamic shape
python tools/deploy.py \
    configs/mmdaction/video-recognition/video-recognition_2d_onnxruntime_static.py \
    tsn_imagenet-pretrained-r50_8xb32-1x1x3-100e_kinetics400-rgb \
    tsn_imagenet-pretrained-r50_8xb32-1x1x3-100e_kinetics400-rgb_20220906-cd10898e.pth \
    tests/data/arm_wrestling.mp4 \
```

(continues on next page)

(continued from previous page)

```
--work-dir mmdeploy_models/mmaaction/tsn/ort \
--device cpu \
--show \
--dump-info
```

## 24.3 Model specification

Before moving on to model inference chapter, let's know more about the converted model structure which is very important for model inference.

The converted model locates in the working directory like `mmdeploy_models/mmaaction/tsn/ort` in the previous example. It includes:

```
mmdeploy_models/mmaaction/tsn/ort
├── deploy.json
├── detail.json
├── end2end.onnx
└── pipeline.json
```

in which,

- **end2end.onnx**: backend model which can be inferred by ONNX Runtime
- **\*.json**: the necessary information for mmdeploy SDK

The whole package `mmdeploy_models/mmaaction/tsn/ort` is defined as **mmdeploy SDK model**, i.e., **mmdeploy SDK model** includes both backend model and inference meta information.

## 24.4 Model Inference

### 24.4.1 Backend model inference

Take the previous converted `end2end.onnx` mode of `tsn` as an example, you can use the following code to inference the model and visualize the results.

```
from mmdeploy.apis.utils import build_task_processor
from mmdeploy.utils import get_input_shape, load_config
import numpy as np
import torch

deploy_cfg = 'configs/mmaaction/video-recognition/video-recognition_2d_onnxruntime_static.
↳py'
model_cfg = 'tsn_imagenet-pretrained-r50_8xb32-1x1x3-100e_kinetics400-rgb'
device = 'cpu'
backend_model = ['./mmdeploy_models/mmaaction2/tsn/ort/end2end.onnx']
image = 'tests/data/arm_wrestling.mp4'

# read deploy_cfg and model_cfg
deploy_cfg, model_cfg = load_config(deploy_cfg, model_cfg)
```

(continues on next page)

(continued from previous page)

```
# build task and backend model
task_processor = build_task_processor(model_cfg, deploy_cfg, device)
model = task_processor.build_backend_model(backend_model)

# process input image
input_shape = get_input_shape(deploy_cfg)
model_inputs, _ = task_processor.create_input(image, input_shape)

# do model inference
with torch.no_grad():
    result = model.test_step(model_inputs)

# show top5-results
pred_scores = result[0].pred_scores.item.tolist()
top_index = np.argsort(pred_scores)[::-1]
for i in range(5):
    index = top_index[i]
    print(index, pred_scores[index])
```

### 24.4.2 SDK model inference

Given the above SDK model of tsnn you can also perform SDK model inference like following,

#### Video recognition SDK model inference

```
from mmdeploy_python import VideoRecognizer
import cv2

# refer to demo/python/video_recognition.py
# def SampleFrames(cap, clip_len, frame_interval, num_clips):
# ...

cap = cv2.VideoCapture('tests/data/arm_wrestling.mp4')

clips, info = SampleFrames(cap, 1, 1, 25)

# create a recognizer
recognizer = VideoRecognizer(model_path='./mmdeploy_models/mmaction/tsnn/ort', device_
    name='cpu', device_id=0)
# perform inference
result = recognizer(clips, info)
# show inference result
for label_id, score in result:
    print(label_id, score)
```

Besides python API, mmdeploy SDK also provides other FFI (Foreign Function Interface), such as C, C++, C#, Java and so on. You can learn their usage from [demos](#).

MMAction2 only API of c, c++ and python for now.

## 24.5 Supported models

## **SUPPORTED NCNN FEATURE**

The current use of the ncnn feature is as follows:

The following features cannot be automatically enabled by mmdeploy and you need to manually modify the ncnn build options or adjust the running parameters in the SDK

- bf16 inference
- nc4hw4 layout
- Profiling per layer
- Turn off NCNN\_STRING to reduce .so file size
- Set thread number and CPU affinity

## ONNX RUNTIME SUPPORT

### 26.1 Introduction of ONNX Runtime

**ONNX Runtime** is a cross-platform inference and training accelerator compatible with many popular ML/DNN frameworks. Check its [github](#) for more information.

### 26.2 Installation

*Please note that only **onnxruntime>=1.8.1** of CPU version on Linux platform is supported by now.*

- Install ONNX Runtime python package

```
pip install onnxruntime==1.8.1
```

### 26.3 Build custom ops

#### 26.3.1 Prerequisite

- Download onnxruntime-linux from ONNX Runtime [releases](#), extract it, expose ONNXRUNTIME\_DIR and finally add the lib path to LD\_LIBRARY\_PATH as below:

```
wget https://github.com/microsoft/onnxruntime/releases/download/v1.8.1/onnxruntime-linux-  
x64-1.8.1.tgz  
  
tar -zxvf onnxruntime-linux-x64-1.8.1.tgz  
cd onnxruntime-linux-x64-1.8.1  
export ONNXRUNTIME_DIR=$(pwd)  
export LD_LIBRARY_PATH=$ONNXRUNTIME_DIR/lib:$LD_LIBRARY_PATH
```

## 26.3.2 Build on Linux

```
cd ${MMDEPLOY_DIR} # To MMDeploy root directory
mkdir -p build && cd build
cmake -DMMDEPLOY_TARGET_BACKENDS=ort -DONNXRUNTIME_DIR=${ONNXRUNTIME_DIR} ..
make -j$(nproc) && make install
```

## 26.4 How to convert a model

- You could follow the instructions of tutorial *How to convert model*

## 26.5 How to add a new custom op

## 26.6 Reminder

- The custom operator is not included in [supported operator list](#) in ONNX Runtime.
- The custom operator should be able to be exported to ONNX.

### 26.6.1 Main procedures

Take custom operator `roi_align` for example.

1. Create a `roi_align` directory in ONNX Runtime source directory `${MMDEPLOY_DIR}/csrc/backend_ops/onnxruntime/`
2. Add header and source file into `roi_align` directory `${MMDEPLOY_DIR}/csrc/backend_ops/onnxruntime/roi_align/`
3. Add unit test into `tests/test_ops/test_ops.py` Check here for examples.

Finally, welcome to send us PR of adding custom operators for ONNX Runtime in MMDeploy. :nerd\_face:

## 26.7 References

- [How to export Pytorch model with custom op to ONNX and run it in ONNX Runtime](#)
- [How to add a custom operator/kernel in ONNX Runtime](#)

## OPENVINO SUPPORT

This tutorial is based on Linux systems like Ubuntu-18.04.

### 27.1 Installation

It is recommended to create a virtual environment for the project.

1. Install [OpenVINO](#). It is recommended to use the installer or install using pip. Installation example using pip:

```
pip install opencvino-dev
```

2. \*Optional If you want to use OpenVINO in SDK, you need install OpenVINO with [install\\_guides](#).
3. Install MMDeploy following the [instructions](#).

To work with models from [MMDetection](#), you may need to install it additionally.

### 27.2 Usage

Example:

```
python tools/deploy.py \
  configs/mmdet/detection/detection_openvino_static-300x300.py \
  /mmdetection_dir/mmdetection/configs/ssd/ssd300_coco.py \
  /tmp/snapshots/ssd300_coco_20210803_015428-d231a06e.pth \
  tests/data/tiger.jpeg \
  --work-dir ../deploy_result \
  --device cpu \
  --log-level INFO
```

## 27.3 List of supported models exportable to OpenVINO from MMDetection

The table below lists the models that are guaranteed to be exportable to OpenVINO from MMDetection.

Notes:

- Custom operations from OpenVINO use the domain `org.openvinotoolkit`.
- For faster work in OpenVINO in the Faster-RCNN, Mask-RCNN, Cascade-RCNN, Cascade-Mask-RCNN models the RoiAlign operation is replaced with the `ExperimentalDetectronROIFeatureExtractor` operation in the ONNX graph.
- Models “VFNet” and “Faster R-CNN + DCN” use the custom “DeformableConv2D” operation.

## 27.4 Deployment config

With the deployment config, you can specify additional options for the Model Optimizer. To do this, add the necessary parameters to the `backend_config.mo_options` in the fields `args` (for parameters with values) and `flags` (for flags).

Example:

```
backend_config = dict(  
    mo_options=dict(  
        args=dict(  
            '--mean_values': [0, 0, 0],  
            '--scale_values': [255, 255, 255],  
            '--data_type': 'FP32',  
        }),  
        flags=['--disable_fusing'],  
    )  
)
```

Information about the possible parameters for the Model Optimizer can be found in the [documentation](#).

## 27.5 Troubleshooting

- `ImportError: libpython3.7m.so.1.0: cannot open shared object file: No such file or directory`

To resolve missing external dependency on Ubuntu\*, execute the following command:

```
sudo apt-get install libpython3.7
```

## PPLNN SUPPORT

MMDeploy supports ppl.nn v0.8.1 and later. This tutorial is based on Linux systems like Ubuntu-18.04.

### 28.1 Installation

1. Please install `pypp1` following [install-guide](#).
2. Install MMDeploy following the [instructions](#).

### 28.2 Usage

Example:

```
python tools/deploy.py \
  configs/mmdet/detection/detection_pplnn_dynamic-800x1344.py \
  /mmdetection_dir/mmdetection/configs/retinanet/retinanet_r50_fpn_1x_coco.py \
  /tmp/snapshots/retinanet_r50_fpn_1x_coco_20200130-c2398f9e.pth \
  tests/data/tiger.jpeg \
  --work-dir ../deploy_result \
  --device cuda \
  --log-level INFO
```

## **SNPE FEATURE SUPPORT**

Currently mmdeploy integrates the onnx2dlc model conversion and SDK inference, but the following features are not yet supported:

- GPU\_FP16 mode
- DSP/AIP quantization
- Operator internal profiling
- UDO operator

## TENSORRT SUPPORT

### 30.1 Installation

#### 30.1.1 Install TensorRT

Please install TensorRT 8 follow [install-guide](#).

**Note:**

- pip Wheel File Installation is not supported yet in this repo.
- We strongly suggest you install TensorRT through tar file
- After installation, you'd better add TensorRT environment variables to bashrc by:

```
cd ${TENSORRT_DIR} # To TensorRT root directory
echo '# set env for TensorRT' >> ~/.bashrc
echo "export TENSORRT_DIR=${TENSORRT_DIR}" >> ~/.bashrc
echo 'export LD_LIBRARY_PATH=$TENSORRT_DIR/lib:$TENSORRT_DIR' >> ~/.bashrc
source ~/.bashrc
```

#### 30.1.2 Build custom ops

Some custom ops are created to support models in OpenMMLab, and the custom ops can be built as follow:

```
cd ${MMDEPLOY_DIR} # To MMDeploy root directory
mkdir -p build && cd build
cmake -DMMDEPLOY_TARGET_BACKENDS=trt ..
make -j$(nproc)
```

If you haven't installed TensorRT in the default path, Please add `-DTENSORRT_DIR` flag in CMake.

```
cmake -DMMDEPLOY_TARGET_BACKENDS=trt -DTENSORRT_DIR=${TENSORRT_DIR} ..
make -j$(nproc) && make install
```

## 30.2 Convert model

Please follow the tutorial in *How to convert model*. **Note** that the device must be cuda device.

### 30.2.1 Int8 Support

Since TensorRT supports INT8 mode, a custom dataset config can be given to calibrate the model. Following is an example for MMDetection:

```
# calibration_dataset.py

# dataset settings, same format as the codebase in OpenMMLab
dataset_type = 'CalibrationDataset'
data_root = 'calibration/dataset/root'
img_norm_cfg = dict(
    mean=[123.675, 116.28, 103.53], std=[58.395, 57.12, 57.375], to_rgb=True)
test_pipeline = [
    dict(type='LoadImageFromFile'),
    dict(
        type='MultiScaleFlipAug',
        img_scale=(1333, 800),
        flip=False,
        transforms=[
            dict(type='Resize', keep_ratio=True),
            dict(type='RandomFlip'),
            dict(type='Normalize', **img_norm_cfg),
            dict(type='Pad', size_divisor=32),
            dict(type='ImageToTensor', keys=['img']),
            dict(type='Collect', keys=['img']),
        ])
]
data = dict(
    samples_per_gpu=2,
    workers_per_gpu=2,
    val=dict(
        type=dataset_type,
        ann_file=data_root + 'val_annotations.json',
        pipeline=test_pipeline),
    test=dict(
        type=dataset_type,
        ann_file=data_root + 'test_annotations.json',
        pipeline=test_pipeline))
evaluation = dict(interval=1, metric='bbox')
```

Convert your model with this calibration dataset:

```
python tools/deploy.py \
    ...
    --calib-dataset-cfg calibration_dataset.py
```

If the calibration dataset is not given, the data will be calibrated with the dataset in model config.

## 30.3 FAQs

- Error Cannot found TensorRT headers or Cannot found TensorRT libs

Try cmake with flag `-DTENSORRT_DIR`:

```
cmake -DBUILD_TENSORRT_OPS=ON -DTENSORRT_DIR=${TENSORRT_DIR} ..
make -j$(nproc)
```

Please make sure there are libs and headers in `${TENSORRT_DIR}`.

- Error `error: parameter check failed at: engine.cpp::setBindingDimensions::1046, condition: profileMinDims.d[i] <= dimensions.d[i]`

There is an input shape limit in deployment config:

```
backend_config = dict(
    # other configs
    model_inputs=[
        dict(
            input_shapes=dict(
                input=dict(
                    min_shape=[1, 3, 320, 320],
                    opt_shape=[1, 3, 800, 1344],
                    max_shape=[1, 3, 1344, 1344]))))
    ])
    # other configs
```

The shape of the tensor input must be limited between `input_shapes["input"]["min_shape"]` and `input_shapes["input"]["max_shape"]`.

- Error `error: [TensorRT] INTERNAL ERROR: Assertion failed: cublasStatus == CUBLAS_STATUS_SUCCESS`

TRT 7.2.1 switches to use cuBLASLt (previously it was cuBLAS). cuBLASLt is the default choice for SM version `>= 7.0`. However, you may need CUDA-10.2 Patch 1 (Released Aug 26, 2020) to resolve some cuBLASLt issues. Another option is to use the new TacticSource API and disable cuBLASLt tactics if you don't want to upgrade.

Read [this](#) for detail.

- Install mmdeploy on Jetson

We provide a tutorial to get start on Jetsons [here](#).

## TORCHSCRIPT SUPPORT

### 31.1 Introduction of TorchScript

**TorchScript** a way to create serializable and optimizable models from PyTorch code. Any TorchScript program can be saved from a Python process and loaded in a process where there is no Python dependency. Check the [Introduction to TorchScript](#) for more details.

### 31.2 Build custom ops

#### 31.2.1 Prerequisite

- Download libtorch from the official website [here](#).

*Please note that only **Pre-cxx11 ABI** and **version 1.8.1+** on Linux platform are supported by now.*

For previous versions of libtorch, users can find through the [issue comment](#). Libtorch1.8.1+cu111 as an example, extract it, expose Torch\_DIR and add the lib path to LD\_LIBRARY\_PATH as below:

```
wget https://download.pytorch.org/libtorch/cu111/libtorch-shared-with-deps-1.8.1%2Bcu111.
↪ zip
unzip libtorch-shared-with-deps-1.8.1+cu111.zip
cd libtorch
export Torch_DIR=$(pwd)
export LD_LIBRARY_PATH=$Torch_DIR/lib:$LD_LIBRARY_PATH
```

Note:

- If you want to save libtorch env variables to bashrc, you could run

```
echo '# set env for libtorch' >> ~/.bashrc
echo "export Torch_DIR=${Torch_DIR}" >> ~/.bashrc
echo 'export LD_LIBRARY_PATH=$Torch_DIR/lib:$LD_LIBRARY_PATH' >> ~/.bashrc
source ~/.bashrc
```

### 31.2.2 Build on Linux

```
cd ${MMDEPLOY_DIR} # To MMDeploy root directory
mkdir -p build && cd build
cmake -DMMDEPLOY_TARGET_BACKENDS=torchscript -DTorch_DIR=${Torch_DIR} ..
make -j$(nproc) && make install
```

## 31.3 How to convert a model

- You could follow the instructions of tutorial [How to convert model](#)

## 31.4 SDK backend

TorchScript SDK backend may be built by passing `-DMMDEPLOY_TORCHSCRIPT_SDK_BACKEND=ON` to `cmake`.

Notice that `libtorch` is sensitive to C++ ABI versions. On platforms defaulted to C++11 ABI (e.g. Ubuntu 16+) one may pass `-DCMAKE_CXX_FLAGS="-D_GLIBCXX_USE_CXX11_ABI=0"` to `cmake` to use pre-C++11 ABI for building. In this case all dependencies with ABI sensitive interfaces (e.g. OpenCV) must be built with pre-C++11 ABI.

## 31.5 FAQs

- Error: `projects/thirdparty/libtorch/share/cmake/Caffe2/Caffe2Config.cmake:96 (message):Your installed Caffe2 version uses cuDNN but I cannot find the cuDNN libraries. Please set the proper cuDNN prefixes and / or install cuDNN.`

May export `CUDNN_ROOT=/root/path/to/cudnn` to resolve the build error.

## SUPPORTED RKNN FEATURE

Currently, MMDeploy only tests rk3588 and rv1126 with linux platform.

The following features cannot be automatically enabled by mmdeploy and you need to manually modify the configuration in MMDeploy like [here](#).

- target\_platform other than default
- quantization settings
- optimization level other than 1

## **TVM FEATURE SUPPORT**

MMDeploy has integrated TVM for model conversion and SDK. Features include:

- AutoTVM tuner
- Ansor tuner
- Graph Executor runtime
- Virtual machine runtime

## CORE ML FEATURE SUPPORT

MMDeploy support convert Pytorch model to Core ML and inference.

### 34.1 Installation

To convert the model in mmdet, you need to compile libtorch to support custom operators such as nms.

```
cd ${PYTORCH_DIR}
mkdir build && cd build
cmake .. \
  -DCMAKE_BUILD_TYPE=Release \
  -DPYTHON_EXECUTABLE=`which python` \
  -DCMAKE_INSTALL_PREFIX=install \
  -DDISABLE_SVE=ON # low version like 1.8.0 of pytorch need this option
make install
```

### 34.2 Usage

```
python tools/deploy.py \
  configs/mmdet/detection/detection_coreml_static-800x1344.py \
  /mmdetection_dir/configs/retinanet/retinanet_r18_fpn_1x_coco.py \
  /checkpoint/retinanet_r18_fpn_1x_coco_20220407_171055-614fd399.pth \
  /mmdetection_dir/demo/demo.jpg \
  --work-dir work_dir/retinanet \
  --device cpu \
  --dump-info
```

## ONNX RUNTIME OPS

- *ONNX Runtime Ops*
  - *grid\_sampler*
    - \* *Description*
    - \* *Parameters*
    - \* *Inputs*
    - \* *Outputs*
    - \* *Type Constraints*
  - *MMCVModulatedDeformConv2d*
    - \* *Description*
    - \* *Parameters*

    - \* *Outputs*
    - \* *Type Constraints*

## 35.1 grid\_sampler

### 35.1.1 Description

Perform sample from `input` with pixel locations from `grid`.

### 35.1.2 Parameters

### 35.1.3 Inputs

### 35.1.4 Outputs

### 35.1.5 Type Constraints

- T:tensor(float32, Linear)

## 35.2 MMCVModulatedDeformConv2d

### 35.2.1 Description

Perform Modulated Deformable Convolution on input feature, read [Deformable ConvNets v2: More Deformable, Better Results](#) for detail.

### 35.2.2 Parameters

### 35.2.3 Inputs

### 35.2.4 Outputs

### 35.2.5 Type Constraints

- T:tensor(float32, Linear)

## 35.3 NMSRotated

### 35.3.1 Description

Non Max Suppression for rotated bboxes.

### 35.3.2 Parameters

### 35.3.3 Inputs

### 35.3.4 Outputs

### 35.3.5 Type Constraints

- T:tensor(float32, Linear)

## 35.4 RoIAlignRotated

### 35.4.1 Description

Perform RoIAlignRotated on output feature, used in bbox\_head of most two-stage rotated object detectors.

### 35.4.2 Parameters

### 35.4.3 Inputs

### 35.4.4 Outputs

### 35.4.5 Type Constraints

- T:tensor(float32)

## 36.1 TRTBatchedNMS

### 36.1.1 Description

Batched NMS with a fixed number of output bounding boxes.

### 36.1.2 Parameters

### 36.1.3 Inputs

### 36.1.4 Outputs

### 36.1.5 Type Constraints

- T:tensor(float32, Linear)

## 36.2 grid\_sampler

### 36.2.1 Description

Perform sample from input with pixel locations from grid.

### 36.2.2 Parameters

### 36.2.3 Inputs

### 36.2.4 Outputs

### 36.2.5 Type Constraints

- T:tensor(float32, Linear)

## 36.3 MMCVInstanceNormalization

### 36.3.1 Description

Carry out instance normalization as described in the paper <https://arxiv.org/abs/1607.08022>.

$y = \text{scale} * (x - \text{mean}) / \sqrt{\text{variance} + \text{epsilon}} + B$ , where mean and variance are computed per instance per channel.

### 36.3.2 Parameters

### 36.3.3 Inputs

### 36.3.4 Outputs

### 36.3.5 Type Constraints

- T:tensor(float32, Linear)

## 36.4 MMCVModulatedDeformConv2d

### 36.4.1 Description

Perform Modulated Deformable Convolution on input feature. Read [Deformable ConvNets v2: More Deformable, Better Results](#) for detail.

### 36.4.2 Parameters

### 36.4.3 Inputs

### 36.4.4 Outputs

### 36.4.5 Type Constraints

- T:tensor(float32, Linear)

## 36.5 MMCVMultiLevelRoIAlign

### 36.5.1 Description

Perform RoIAlign on features from multiple levels. Used in bbox\_head of most two-stage detectors.

### 36.5.2 Parameters

### 36.5.3 Inputs

### 36.5.4 Outputs

### 36.5.5 Type Constraints

- T:tensor(float32, Linear)

## 36.6 MMCVRoIAlign

### 36.6.1 Description

Perform RoIAlign on output feature, used in bbox\_head of most two-stage detectors.

### 36.6.2 Parameters

### 36.6.3 Inputs

### 36.6.4 Outputs

### 36.6.5 Type Constraints

- T:tensor(float32, Linear)

## 36.7 ScatterND

### 36.7.1 Description

ScatterND takes three inputs `data` tensor of rank  $r \geq 1$ , `indices` tensor of rank  $q \geq 1$ , and `updates` tensor of rank  $q + r - \text{indices.shape}[-1] - 1$ . The output of the operation is produced by creating a copy of the input `data`, and then updating its value to values specified by `updates` at specific index positions specified by `indices`. Its output shape is the same as the shape of `data`. Note that `indices` should not have duplicate entries. That is, two or more updates for the same index-location is not supported.

The output is calculated via the following equation:

```
output = np.copy(data)
update_indices = indices.shape[:-1]
for idx in np.ndindex(update_indices):
    output[indices[idx]] = updates[idx]
```

### 36.7.2 Parameters

None

### 36.7.3 Inputs

### 36.7.4 Outputs

### 36.7.5 Type Constraints

- T:tensor(float32, Linear), tensor(int32, Linear)

## 36.8 TRTBatchedRotatedNMS

### 36.8.1 Description

Batched rotated NMS with a fixed number of output bounding boxes.

### 36.8.2 Parameters

### 36.8.3 Inputs

### 36.8.4 Outputs

### 36.8.5 Type Constraints

- T:tensor(float32, Linear)

## 36.9 GridPriorsTRT

### 36.9.1 Description

Generate the anchors for object detection task.

### 36.9.2 Parameters

### 36.9.3 Inputs

### 36.9.4 Outputs

### 36.9.5 Type Constraints

- T:tensor(float32, Linear)
- TAny: Any

## 36.10 ScaledDotProductAttentionTRT

### 36.10.1 Description

Dot product attention used to support multihead attention, read [Attention Is All You Need](#) for more detail.

### 36.10.2 Parameters

None

### 36.10.3 Inputs

### 36.10.4 Outputs

### 36.10.5 Type Constraints

- T:tensor(float32, Linear)

## 36.11 GatherTopk

### 36.11.1 Description

TensorRT 8.2~8.4 would give unexpected result for multi-index gather.

`data[batch_index, bbox_index, ...]`

Read [this](#) for more details.

### 36.11.2 Parameters

None

### 36.11.3 Inputs

### 36.11.4 Outputs

### 36.11.5 Type Constraints

- T:tensor(float32, Linear), tensor(int32, Linear)

## NCNN OPS

## 37.1 Expand

### 37.1.1 Description

Broadcast the input blob following the given shape and the broadcast rule of ncnn.

### 37.1.2 Parameters

Expand has no parameters.

### 37.1.3 Inputs

### 37.1.4 Outputs

### 37.1.5 Type Constraints

- ncnn.Mat: Mat(float32)

## 37.2 Gather

### 37.2.1 Description

Given the data and indice blob, gather entries of the axis dimension of data indexed by indices.

### 37.2.2 Parameters

### 37.2.3 Inputs

### 37.2.4 Outputs

### 37.2.5 Type Constraints

- ncnn.Mat: Mat(float32)

## 37.3 Shape

### 37.3.1 Description

Get the shape of the ncnn blobs.

### 37.3.2 Parameters

Shape has no parameters.

### 37.3.3 Inputs

### 37.3.4 Outputs

### 37.3.5 Type Constraints

- ncnn.Mat: Mat(float32)

## 37.4 TopK

### 37.4.1 Description

Get the indices and value(optional) of largest or smallest k data among the axis. This op will map to onnx op TopK, ArgMax, and ArgMin.

### 37.4.2 Parameters

### 37.4.3 Inputs

### 37.4.4 Outputs

### 37.4.5 Type Constraints

- ncnn.Mat: Mat(float32)

## MMDEPLOY ARCHITECTURE

This article mainly introduces the functions of each directory of mmdeploy and how it works from model conversion to real inference.

### 38.1 Take a general look at the directory structure

The entire mmdeploy can be seen as two independent parts: model conversion and SDK.

We introduce the entire repo directory structure and functions, without having to study the source code, just have an impression.

Peripheral directory features:

```
$ cd /path/to/mmdploy
$ tree -L 1
.
├── CMakeLists.txt      # Compile custom operator and cmake configuration of SDK
├── configs              # Algorithm library configuration for model conversion
├── csrc                # SDK and custom operator
├── demo                # FFI interface examples in various languages, such as
└─> csharp, java, python, etc.
├── docker              # docker build
├── mmdploy             # python package for model conversion
├── requirements        # python requirements
├── service             # Some small boards not support python, we use C/S mode
└─> for model conversion, here is server code
├── tests               # unittest
├── third_party         # 3rd party dependencies required by SDK and FFI
├── tools               # Tools are also the entrance to all functions, such as
└─> onnx2xx.py, profiler.py, test.py, etc.
```

It should be clear

- Model conversion mainly depends on tools, mmdploy and small part of csrc directory;
- SDK is consist of three directories: csrc, third\_party and demo.

## 38.2 Model Conversion

Here we take ViT of mmcls as model example, and take ncnn as inference backend example. Other models and inferences are similar.

Let's take a look at the mmdeploy/mmdeploy directory structure and get an impression:

```
.
├── apis                                # The api used by tools is implemented here, such_
├── as onnx2ncnn.py
│   ├── calibration.py                # trt dedicated collection of quantitative data
│   ├── core                          # Software infrastructure
│   ├── extract_model.py             # Use it to export part of onnx
│   ├── inference.py                 # Abstract function, which will actually call torch/
├── ncnn specific inference
│   ├── ncnn                         # ncnn Wrapper
│   └── visualize.py                 # Still an abstract function, which will actually call_
├── torch/ncnn specific inference and visualize

│   ├── base                         # Because there are multiple backends, there_
├── must be an OO design for the base class
│   ├── ncnn                         # This calls the ncnn python interface for model_
├── conversion
│   ├── init_plugins.py              # Find the path of ncnn custom operators and ncnn_
├── tools
│   ├── onnx2ncnn.py                 # Wrap `mmdeploy_onnx2ncnn` into a python interface
│   ├── quant.py                     # Wrap `ncnn2int8` as a python interface
│   └── wrapper.py                   # Wrap pyncnn forward API
..
├── codebase                           # Algorithm rewriter
│   ├── base                         # There are multiple algorithms here that we need_
├── a bit of OO design
│   ├── mmcls                        # mmcls related model rewrite
│   │   └── deploy                    # mmcls implementation of base abstract task/
├── model/codebase
│   │   └── models                    # Real model rewrite
│   │       ├── backbones             # Rewrites of backbone network parts, such as_
├── multiheadattention
│   │   ├── heads                     # Such as MultiLabelClsHead
│   │   └── necks                     # Such as GlobalAveragePooling
..
├── core                               # Software infrastructure of rewrite mechanism
├── mmcv                               # Rewrite mmcv
├── pytorch                           # Rewrite pytorch operator for ncnn, such as Gemm
..
```

Each line above needs to be read, don't skip it.

When typing tools/deploy.py to convert ViT, these are 3 things:

1. Rewrite of mmcls ViT forward
2. ncnn does not support gather opr, customize and load it with libncnn.so
3. Run exported ncnn model with real inference, render output, and make sure the result is correct

### 38.2.1 1. Rewrite forward

Because when exporting ViT to onnx, it generates some operators that ncnn doesn't support perfectly, mmdeploy's solution is to hijack the forward code and change it. The output onnx is suitable for ncnn.

For example, rewrite the process of `conv -> shape -> concat_const -> reshape` to `conv -> reshape` to trim off the redundant `shape` and `concat` operator.

All mmcls algorithm rewriters are in the `mmdeploy/codebase/mmcls/models` directory.

### 38.2.2 2. Custom Operator

Operators customized for ncnn are in the `csrc/mmdelay/backend_ops/ncnn/` directory, and are loaded together with `libncnn.so` after compilation. The essence is in hotfix ncnn, which currently implements these operators:

- topk
- tensorslice
- shpe
- gather
- expand
- constantofshape

### 38.2.3 3. Model Conversion and testing

We first use the modified `mmdeploy_onnx2ncnn` to convert model, then inference with `pyncnn` and custom ops.

When encountering a framework such as snpe that does not support python well, we use C/S mode: wrap a server with protocols such as gRPC, and forward the real inference output.

For Rendering, mmdeploy directly uses the rendering API of upstream algorithm codebase.

## 38.3 SDK

After the model conversion completed, the SDK compiled with C++ can be used to execute on different platforms.

Let's take a look at the `csrc/mmdelay` directory structure:

```
.
├── apis                # csharp, java, go, Rust and other FFI interfaces
├── backend_ops         # Custom operators for each inference framework
├── CMakeLists.txt
├── codebase            # The type of results preferred by each algorithm framework, such as
├──   └─ multi-use bbox for detection task
├── core                # Abstraction of graph, operator, device and so on
├── device              # Implementation of CPU/GPU device abstraction
├── execution           # Implementation of the execution abstraction
├── graph               # Implementation of graph abstraction
├── model               # Implement both zip-compressed and uncompressed work directory
├── net                 # Implementation of net, such as wrap ncnn forward C API
├── preprocess          # Implement preprocess
└── utils               # OCV tools
```

The essence of the SDK is to design a set of abstraction of the computational graph, and combine the **multiple models**'

- preprocess
- inference
- postprocess

Provide FFI in multiple languages at the same time.

## HOW TO SUPPORT NEW MODELS

We provide several tools to support model conversion.

### 39.1 Function Rewriter

The PyTorch neural network is written in python that eases the development of the algorithm. But the use of Python control flow and third-party libraries make it difficult to export the network to an intermediate representation. We provide a ‘monkey patch’ tool to rewrite the unsupported function to another one that can be exported. Here is an example:

```
from mmdesploy.core import FUNCTION_REWRITER

@FUNCTION_REWRITER.register_rewriter(
    func_name='torch.Tensor.repeat', backend='tensorrt')
def repeat_static(input, *size):
    ctx = FUNCTION_REWRITER.get_context()
    origin_func = ctx.origin_func
    if input.dim() == 1 and len(size) == 1:
        return origin_func(input.unsqueeze(0), *([1] + list(size))).squeeze(0)
    else:
        return origin_func(input, *size)
```

It is easy to use the function rewriter. Just add a decorator with arguments:

- `func_name` is the function to override. It can be either a PyTorch function or a custom function. Methods in modules can also be overridden by this tool.
- `backend` is the inference engine. The function will be overridden when the model is exported to this engine. If it is not given, this rewrite will be the default rewrite. The default rewrite will be used if the rewrite of the given backend does not exist.

The arguments are the same as the original function, except a context `ctx` as the first argument. The context provides some useful information such as the deployment config `ctx.cfg` and the original function (which has been overridden) `ctx.origin_func`.

## 39.2 Module Rewriter

If you want to replace a whole module with another one, we have another rewriter as follows:

```
@MODULE_REWRITER.register_rewrite_module(
    'mmedit.models.backbones.sr_backbones.SRCNN', backend='tensorrt')
class SRCNNWrapper(nn.Module):

    def __init__(self,
                  module,
                  cfg,
                  channels=(3, 64, 32, 3),
                  kernel_sizes=(9, 1, 5),
                  upscale_factor=4):
        super(SRCNNWrapper, self).__init__()

        self._module = module

        module.img_upsampler = nn.Upsample(
            scale_factor=module.upscale_factor,
            mode='bilinear',
            align_corners=False)

    def forward(self, *args, **kwargs):
        """Run forward."""
        return self._module(*args, **kwargs)

    def init_weights(self, *args, **kwargs):
        """Initialize weights."""
        return self._module.init_weights(*args, **kwargs)
```

Just like function rewriter, add a decorator with arguments:

- `module_type` the module class to rewrite.
- `backend` is the inference engine. The function will be overridden when the model is exported to this engine. If it is not given, this rewrite will be the default rewrite. The default rewrite will be used if the rewrite of the given backend does not exist.

All instances of the module in the network will be replaced with instances of this new class. The original module and the deployment config will be passed as the first two arguments.

## 39.3 Custom Symbolic

The mappings between PyTorch and ONNX are defined in PyTorch with symbolic functions. The custom symbolic function can help us to bypass some ONNX nodes which are unsupported by inference engine.

```
@SYMBOLIC_REWRITER.register_symbolic('squeeze', is_pytorch=True)
def squeeze_default(g, self, dim=None):
    if dim is None:
        dims = []
        for i, size in enumerate(self.type().sizes()):
            if size == 1:
```

(continues on next page)

(continued from previous page)

```
        dims.append(i)
    else:
        dims = [sym_help._get_const(dim, 'i', 'dim')]
    return g.op('Squeeze', self, axes_i=dims)
```

The decorator arguments:

- **func\_name** The function name to add symbolic. Use full path if it is a custom `torch.autograd.Function`. Or just a name if it is a PyTorch built-in function.
- **backend** is the inference engine. The function will be overridden when the model is exported to this engine. If it is not given, this rewrite will be the default rewrite. The default rewrite will be used if the rewrite of the given backend does not exist.
- **is\_pytorch** True if the function is a PyTorch built-in function.
- **arg\_descriptors** the descriptors of the symbolic function arguments. Will be feed to `torch.onnx.symbolic_helper._parse_arg`.

Just like function rewriter, there is a context `ctx` as the first argument. The context provides some useful information such as the deployment config `ctx.cfg` and the original function (which has been overridden) `ctx.origin_func`. Note that the `ctx.origin_func` can be used only when `is_pytorch==False`.

## HOW TO SUPPORT NEW BACKENDS

MMDeploy supports a number of backend engines. We welcome the contribution of new backends. In this tutorial, we will introduce the general procedures to support a new backend in MMDeploy.

### 40.1 Prerequisites

Before contributing the codes, there are some requirements for the new backend that need to be checked:

- The backend must support ONNX as IR.
- If the backend requires model files or weight files other than a “.onnx” file, a conversion tool that converts the “.onnx” file to model files and weight files is required. The tool can be a Python API, a script, or an executable program.
- It is highly recommended that the backend provides a Python interface to load the backend files and inference for validation.

### 40.2 Support backend conversion

The backends in MMDeploy must support the ONNX. The backend loads the “.onnx” file directly, or converts the “.onnx” to its own format using the conversion tool. In this section, we will introduce the steps to support backend conversion.

1. Add backend constant in `mmdeploy/utils/constants.py` that denotes the name of the backend.

**Example:**

```
# mmdeploy/utils/constants.py

class Backend(AdvancedEnum):
    # Take TensorRT as an example
    TENSORRT = 'tensorrt'
```

2. Add a corresponding package (a folder with `__init__.py`) in `mmdeploy/backend/`. For example, `mmdeploy/backend/tensorrt`. In the `__init__.py`, there must be a function named `is_available` which checks if users have installed the backend library. If the check is passed, then the remaining files of the package will be loaded.

**Example:**

```
# mmdploy/backend/tensorrt/__init__.py

def is_available():
    return importlib.util.find_spec('tensorrt') is not None

if is_available():
    from .utils import from_onnx, load, save
    from .wrapper import TRTWrapper

    __all__ = [
        'from_onnx', 'save', 'load', 'TRTWrapper'
    ]
```

3. Create a config file in configs/\_base\_/backends (e.g., configs/\_base\_/backends/tensorrt.py). If the backend just takes the '.onnx' file as input, the new config can be simple. The config of the backend only consists of one field denoting the name of the backend (which should be same as the name in mmdploy/utils/constants.py).

**Example:**

```
backend_config = dict(type='onnxruntime')
```

If the backend requires other files, then the arguments for the conversion from “.onnx” file to backend files should be included in the config file.

**Example:**

```
backend_config = dict(
    type='tensorrt',
    common_config=dict(
        fp16_mode=False, max_workspace_size=0))
```

After possessing a base backend config file, you can easily construct a complete deploy config through inheritance. Please refer to our [config tutorial](#) for more details. Here is an example:

```
_base_ = ['../_base_/backends/onnxruntime.py']

codebase_config = dict(type='mmcls', task='Classification')
onnx_config = dict(input_shape=None)
```

4. If the backend requires model files or weight files other than a “.onnx” file, create a onnx2backend.py file in the corresponding folder (e.g., create mmdploy/backend/tensorrt/onnx2tensorrt.py). Then add a conversion function onnx2backend in the file. The function should convert a given “.onnx” file to the required backend files in a given work directory. There are no requirements on other parameters of the function and the implementation details. You can use any tools for conversion. Here are some examples:

**Use Python script:**

```
def onnx2opencv(input_info: Dict[str, Union[List[int], torch.Size]],
                output_names: List[str], onnx_path: str, work_dir: str):

    input_names = ','.join(input_info.keys())
    input_shapes = ','.join(str(list(elem)) for elem in input_info.values())
    output = ','.join(output_names)
```

(continues on next page)

(continued from previous page)

```

mo_args = f'--input_model="{onnx_path}" '\
          f'--output_dir="{work_dir}" ' \
          f'--output="{output}" ' \
          f'--input="{input_names}" ' \
          f'--input_shape="{input_shapes}" ' \
          f'--disable_fusing '
command = f'mo.py {mo_args}'
mo_output = run(command, stdout=PIPE, stderr=PIPE, shell=True, check=True)

```

**Use executable program:**

```

def onnx2ncnn(onnx_path: str, work_dir: str):
    onnx2ncnn_path = get_onnx2ncnn_path()
    save_param, save_bin = get_output_model_file(onnx_path, work_dir)
    call([onnx2ncnn_path, onnx_path, save_param, save_bin])\

```

5. Define APIs in a new package in mmdeploy/apis.

**Example:**

```

# mmdeploy/apis/ncnn/__init__.py

from mmdeploy.backend.ncnn import is_available

__all__ = ['is_available']

if is_available():
    from mmdeploy.backend.ncnn.onnx2ncnn import (onnx2ncnn,
                                                  get_output_model_file)
    __all__ += ['onnx2ncnn', 'get_output_model_file']

```

Create a backend manager class which derive from BaseBackendManager, implement its to\_backend static method.

**Example:**

```

@classmethod
def to_backend(cls,
               ir_files: Sequence[str],
               deploy_cfg: Any,
               work_dir: str,
               log_level: int = logging.INFO,
               device: str = 'cpu',
               **kwargs) -> Sequence[str]:
    return ir_files

```

6. Convert the models of OpenMMLab to backends (if necessary) and inference on backend engine. If you find some incompatible operators when testing, you can try to rewrite the original model for the backend following the [rewriter tutorial](#) or add custom operators.
7. Add docstring and unit tests for new code :).

## 40.3 Support backend inference

Although the backend engines are usually implemented in C/C++, it is convenient for testing and debugging if the backend provides Python inference interface. We encourage the contributors to support backend inference in the Python interface of MMDeploy. In this section we will introduce the steps to support backend inference.

1. Add a file named `wrapper.py` to corresponding folder in `mmdeploy/backend/{backend}`. For example, `mmdeploy/backend/tensorrt/wrapper.py`. This module should implement and register a wrapper class that inherits the base class `BaseWrapper` in `mmdeploy/backend/base/base_wrapper.py`.

**Example:**

```
from mmdeploy.utils import Backend
from ..base import BACKEND_WRAPPER, BaseWrapper

@BACKEND_WRAPPER.register_module(Backend.TENSORRT.value)
class TRTWrapper(BaseWrapper):
```

2. The wrapper class can initialize the engine in `__init__` function and inference in `forward` function. Note that the `__init__` function must take a parameter `output_names` and pass it to base class to determine the orders of output tensors. The input and output variables of `forward` should be dictionaries denoting the name and value of the tensors.
3. For the convenience of performance testing, the class should define a “execute” function that only calls the inference interface of the backend engine. The `forward` function should call the “execute” function after pre-processing the data.

**Example:**

```
from mmdeploy.utils import Backend
from mmdeploy.utils.timer import TimeCounter
from ..base import BACKEND_WRAPPER, BaseWrapper

@BACKEND_WRAPPER.register_module(Backend.ONNXRUNTIME.value)
class ORTWrapper(BaseWrapper):

    def __init__(self,
                 onnx_file: str,
                 device: str,
                 output_names: Optional[Sequence[str]] = None):
        # Initialization
        # ...
        super().__init__(output_names)

    def forward(self, inputs: Dict[str, torch.Tensor]) -> Dict[str, torch.Tensor]:
        # Fetch data
        # ...

        self.__ort_execute(self.io_binding)

        # Postprocess data
        # ...

    @TimeCounter.count_time('onnxruntime')
```

(continues on next page)

(continued from previous page)

```
def __ort_execute(self, io_binding: ort.IOBinding):
    # Only do the inference
    self.sess.run_with_iobinding(io_binding)
```

4. Create a backend manager class which derive from BaseBackendManager, implement its build\_wrapper static method.

**Example:**

```
@BACKEND_MANAGERS.register('onnxruntime')
class ONNXRuntimeManager(BaseBackendManager):
    @classmethod
    def build_wrapper(cls,
                      backend_files: Sequence[str],
                      device: str = 'cpu',
                      input_names: Optional[Sequence[str]] = None,
                      output_names: Optional[Sequence[str]] = None,
                      deploy_cfg: Optional[Any] = None,
                      **kwargs):
        from .wrapper import ORTWrapper
        return ORTWrapper(
            onnx_file=backend_files[0],
            device=device,
            output_names=output_names)
```

5. Add docstring and unit tests for new code :).

## 40.4 Support new backends using MMDeploy as a third party

Previous parts show how to add a new backend in MMDeploy, which requires changing its source codes. However, if we treat MMDeploy as a third party, the methods above are no longer efficient. To this end, adding a new backend requires us pre-install another package named aenum. We can install it directly through `pip install aenum`.

After installing aenum successfully, we can use it to add a new backend through:

```
from mmdeploy.utils.constants import Backend
from aenum import extend_enum

try:
    Backend.get('backend_name')
except Exception:
    extend_enum(Backend, 'BACKEND', 'backend_name')
```

We can run the codes above before we use the rewrite logic of MMDeploy.

## HOW TO ADD TEST UNITS FOR BACKEND OPS

This tutorial introduces how to add unit test for backend ops. When you add a custom op under backend\_ops, you need to add the corresponding test unit. Test units of ops are included in tests/test\_ops/test\_ops.py.

### 41.1 Prerequisite

- **Compile new ops:** After adding a new custom op, needs to recompile the relevant backend, referring to *build.md*.

### 41.2 1. Add the test program test\_XXXX()

You can put unit test for ops in tests/test\_ops/. Usually, the following program template can be used for your custom op.

#### 41.2.1 example of ops unit test

```
@pytest.mark.parametrize('backend', [TEST_TENSORRT, TEST_ONNXRT])           # 1.1 backend_
↪test class
@pytest.mark.parametrize('pool_h,pool_w,spatial_scale,sampling_ratio',      # 1.2 set_
↪parameters of op
                        [(2, 2, 1.0, 2), (4, 4, 2.0, 4)])                  # [(# Examples_
↪of op test parameters),...]
def test_roi_align(backend,
                    pool_h,                                                # set_
↪parameters of op
                    pool_w,
                    spatial_scale,
                    sampling_ratio,
                    input_list=None,
                    save_dir=None):
    backend.check_env()

    if input_list is None:
        input = torch.rand(1, 1, 16, 16, dtype=torch.float32)           # 1.3 op input_
↪data initialization
        single_roi = torch.tensor([[0, 0, 0, 4, 4]], dtype=torch.float32)
    else:
```

(continues on next page)

(continued from previous page)

```
input = torch.tensor(input_list[0], dtype=torch.float32)
single_roi = torch.tensor(input_list[1], dtype=torch.float32)

from mmcv.ops import roi_align

def wrapped_function(torch_input, torch_rois):                                # 1.4
↪ initialize op model to be tested
    return roi_align(torch_input, torch_rois, (pool_w, pool_h),
                      spatial_scale, sampling_ratio, 'avg', True)

wrapped_model = WrapFunction(wrapped_function).eval()

with RewriterContext(cfg={}, backend=backend.backend_name, opset=11): # 1.5 call the
↪ backend test class interface
    backend.run_and_validate(
        wrapped_model, [input, single_roi],
        'roi_align',
        input_names=['input', 'rois'],
        output_names=['roi_feat'],
        save_dir=save_dir)
```

### 41.2.2 1.1 backend test class

We provide some functions and classes for different backends, such as `TestOnnxRTExporter`, `TestTensorRTExporter`, `TestNCNNExporter`.

### 41.2.3 1.2 set parameters of op

Set some parameters of op, such as 'pool\_h', 'pool\_w', 'spatial\_scale', 'sampling\_ratio' in `roi_align`. You can set multiple parameters to test op.

### 41.2.4 1.3 op input data initialization

Initialization required input data.

### 41.2.5 1.4 initialize op model to be tested

The model containing custom op usually has two forms.

- torch model: Torch model with custom operators. Python code related to op is required, refer to `roi_align` unit test.
- onnx model: Onnx model with custom operators. Need to call onnx api to build, refer to `multi_level_roi_align` unit test.

### 41.2.6 1.5 call the backend test class interface

Call the backend test class `run_and_validate` to run and verify the result output by the op on the backend.

```
def run_and_validate(self,
                    model,
                    input_list,
                    model_name='tmp',
                    tolerate_small_mismatch=False,
                    do_constant_folding=True,
                    dynamic_axes=None,
                    output_names=None,
                    input_names=None,
                    expected_result=None,
                    save_dir=None):
```

#### Parameter Description

- `model`: Input model to be tested and it can be torch model or any other backend model.
- `input_list`: List of test data, which is mapped to the order of `input_names`.
- `model_name`: The name of the model.
- `tolerate_small_mismatch`: Whether to allow small errors in the verification of results.
- `do_constant_folding`: Whether to use constant light folding to optimize the model.
- `dynamic_axes`: If you need to use dynamic dimensions, enter the dimension information.
- `output_names`: The node name of the output node.
- `input_names`: The node name of the input node.
- `expected_result`: Expected ground truth values for verification.
- `save_dir`: The folder used to save the output files.

## 41.3 2. Test Methods

Use pytest to call the test function to test ops.

```
pytest tests/test_ops/test_ops.py::test_XXXX
```

## HOW TO TEST REWRITTEN MODELS

After you create a rewritten model using our *rewriter*, it's better to write a unit test for the model to validate if the model rewrite would come into effect. Generally, we need to get outputs of the original model and rewritten model, then compare them. The outputs of the original model can be acquired directly by calling the forward function of the model, whereas the way to generate the outputs of the rewritten model depends on the complexity of the rewritten model.

### 42.1 Test rewritten model with small changes

If the changes to the model are small (e.g., only change the behavior of one or two variables and don't introduce side effects), you can construct the input arguments for the rewritten functions/modules run model's inference in `RewriteContext` and check the results.

```
# mmcls.models.classifiers.base.py
class BaseClassifier(BaseModule, metaclass=ABCMeta):
    def forward(self, img, return_loss=True, **kwargs):
        if return_loss:
            return self.forward_train(img, **kwargs)
        else:
            return self.forward_test(img, **kwargs)

# Custom rewritten function
@FUNCTION_REWRITER.register_rewriter(
    'mmcls.models.classifiers.BaseClassifier.forward', backend='default')
def forward_of_base_classifier(self, img, *args, **kwargs):
    """Rewrite `forward` for default backend."""
    return self.simple_test(img, {})
```

In the example, we only change the function that `forward` calls. We can test this rewritten function by writing the following test function:

```
def test_baseclassifier_forward():
    input = torch.rand(1)
    from mmcls.models.classifiers import BaseClassifier
    class DummyClassifier(BaseClassifier):

        def __init__(self, init_cfg=None):
            super().__init__(init_cfg=init_cfg)

        def extract_feat(self, imgs):
```

(continues on next page)

(continued from previous page)

```

    pass

    def forward_train(self, imgs):
        return 'train'

    def simple_test(self, img, tmp, **kwargs):
        return 'simple_test'

model = DummyClassifier().eval()

model_output = model(input)
with RewriterContext(cfg=dict()), torch.no_grad():
    backend_output = model(input)

assert model_output == 'train'
assert backend_output == 'simple_test'

```

In this test function, we construct a derived class of `BaseClassifier` to test if the rewritten model would work in the rewrite context. We get outputs of the original model by directly calling `model(input)` and get the outputs of the rewritten model by calling `model(input)` in `RewriteContext`. Finally, we can check the outputs by asserting their value.

## 42.2 Test rewritten model with big changes

In the first example, the output is generated in Python. Sometimes we may make big changes to original model functions (e.g., eliminate branch statements to generate correct computing graph). Even if the outputs of a rewritten model running in Python are correct, we cannot assure that the rewritten model can work as expected in the backend. Therefore, we need to test the rewritten model in the backend.

```

# Custom rewritten function
@FUNCTION_REWRITER.register_rewriter(
    func_name='mmseg.models.segmentors.BaseSegmentor.forward')
def base_segmentor__forward(self, img, img_metas=None, **kwargs):
    ctx = FUNCTION_REWRITER.get_context()
    if img_metas is None:
        img_metas = {}
    assert isinstance(img_metas, dict)
    assert isinstance(img, torch.Tensor)

    deploy_cfg = ctx.cfg
    is_dynamic_flag = is_dynamic_shape(deploy_cfg)
    img_shape = img.shape[2:]
    if not is_dynamic_flag:
        img_shape = [int(val) for val in img_shape]
    img_metas['img_shape'] = img_shape
    return self.simple_test(img, img_metas, **kwargs)

```

The behavior of this rewritten function is complex. We should test it as follows:

```

def test_basesegmentor_forward():
    from mmdeploy.utils.test import (WrapModel, get_model_outputs,
                                     get_rewrite_outputs)

    segmentor = get_model()
    segmentor.cpu().eval()

    # Prepare data
    # ...

    # Get the outputs of original model
    model_inputs = {
        'img': [imgs],
        'img_metas': [img_metas],
        'return_loss': False
    }
    model_outputs = get_model_outputs(segmentor, 'forward', model_inputs)

    # Get the outputs of rewritten model
    wrapped_model = WrapModel(segmentor, 'forward', img_metas = None, return_loss =
False)
    rewrite_inputs = {'img': imgs}
    rewrite_outputs, is_backend_output = get_rewrite_outputs(
        wrapped_model=wrapped_model,
        model_inputs=rewrite_inputs,
        deploy_cfg=deploy_cfg)
    if is_backend_output:
        # If the backend plugins have been installed, the rewrite outputs are
        # generated by backend.
        rewrite_outputs = torch.tensor(rewrite_outputs)
        model_outputs = torch.tensor(model_outputs)
        model_outputs = model_outputs.unsqueeze(0).unsqueeze(0)
        assert torch.allclose(rewrite_outputs, model_outputs)
    else:
        # Otherwise, the outputs are generated by python.
        assert rewrite_outputs is not None

```

We provide some utilities to test rewritten functions. At first, you can construct a model and call `get_model_outputs` to get outputs of the original model. Then you can wrap the rewritten function with `WrapModel`, which serves as a partial function, and get the results with `get_rewrite_outputs`. `get_rewrite_outputs` returns two values that indicate the content of outputs and whether the outputs come from the backend. Because we cannot assume that everyone has installed the backend, we should check if the results are generated by a Python or backend engine. The unit test must cover both conditions. Finally, we should compare the original and rewritten outputs, which may be done simply by calling `torch.allclose`.

## 42.3 Note

To learn the complete usage of the test utilities, please refer to our apis document.

## HOW TO GET PARTITIONED ONNX MODELS

MMDeploy supports exporting PyTorch models to partitioned onnx models. With this feature, users can define their partition policy and get partitioned onnx models at ease. In this tutorial, we will briefly introduce how to support partition a model step by step. In the example, we would break YOLOV3 model into two parts and extract the first part without the post-processing (such as anchor generating and NMS) in the onnx model.

### 43.1 Step 1: Mark inputs/outputs

To support the model partition, we need to add Mark nodes in the ONNX model. This could be done with `mmdeploy`'s `@mark` decorator. Note that to make the mark work, the marking operation should be included in a rewriting function.

At first, we would mark the model input, which could be done by marking the input tensor `img` in the forward method of `BaseDetector` class, which is the parent class of all detector classes. Thus we name this marking point as `detector_forward` and mark the inputs as `input`. Since there could be three outputs for detectors such as Mask RCNN, the outputs are marked as `dets`, `labels`, and `masks`. The following code shows the idea of adding mark functions and calling the mark functions in the rewrite. For source code, you could refer to [mmdeploy/codebase/mmdet/models/detectors/single\\_stage.py](https://github.com/open-mmlab/mmdetection/blob/master/mmdet/models/detectors/single_stage.py)

```
from mmdeploy.core import FUNCTION_REWRITER, mark

@mark(
    'detector_forward', inputs=['input'], outputs=['dets', 'labels', 'masks'])
def __forward_impl(self, img, img_metas=None, **kwargs):
    ...

@FUNCTION_REWRITER.register_rewriter(
    'mmdet.models.detectors.base.BaseDetector.forward')
def base_detector__forward(self, img, img_metas=None, **kwargs):
    ...
    # call the mark function
    return __forward_impl(...)
```

Then, we have to mark the output feature of `YOLOV3Head`, which is the input argument `pred_maps` in `get_bboxes` method of `YOLOV3Head` class. We could add a internal function to only mark the `pred_maps` inside `yolov3_head__get_bboxes` function as following.

```
from mmdeploy.core import FUNCTION_REWRITER, mark

@FUNCTION_REWRITER.register_rewriter(
```

(continues on next page)

(continued from previous page)

```

    func_name='mmdet.models.dense_heads.YOLOV3Head.get_bboxes')
def yolov3_head__get_bboxes(self,
                             pred_maps,
                             img metas,
                             cfg=None,
                             rescale=False,
                             with_nms=True):
    # mark pred_maps
    @mark('yolo_head', inputs=['pred_maps'])
    def __mark_pred_maps(pred_maps):
        return pred_maps
    pred_maps = __mark_pred_maps(pred_maps)
    ...

```

Note that `pred_maps` is a list of Tensor and it has three elements. Thus, three Mark nodes with op name as `pred_maps.0`, `pred_maps.1`, `pred_maps.2` would be added in the onnx model.

## 43.2 Step 2: Add partition config

After marking necessary nodes that would be used to split the model, we could add a deployment config file `configs/mmdet/detection/yolov3_partition_onnxruntime_static.py`. If you are not familiar with how to write config, you could check [write\\_config.md](#).

In the config file, we need to add `partition_config`. The key part is `partition_cfg`, which contains elements of dict that designates the start nodes and end nodes of each model segments. Since we only want to keep YOLOV3 without post-processing, we could set the start as `['detector_forward:input']`, and end as `['yolo_head:input']`. Note that start and end can have multiple marks.

```

_base_ = ['./detection_onnxruntime_static.py']

onnx_config = dict(input_shape=[608, 608])
partition_config = dict(
    type='yolov3_partition', # the partition policy name
    apply_marks=True, # should always be set to True
    partition_cfg=[
        dict(
            save_file='yolov3.onnx', # filename to save the partitioned onnx model
            start=['detector_forward:input'], # [mark_name:input/output, ...]
            end=['yolo_head:input'], # [mark_name:input/output, ...]
            output_names=[f'pred_maps.{i}' for i in range(3)]) # output names
    ])

```

## 43.3 Step 3: Get partitioned onnx models

Once we have marks of nodes and the deployment config with `partition_config` being set properly, we could use the *tool* `torch2onnx` to export the model to onnx and get the partition onnx files.

```
python tools/torch2onnx.py \
configs/mmdet/detection/yolov3_partition_onnxruntime_static.py \
../mmdetection/configs/yolo/yolov3_d53_8xb8-ms-608-273e_coco.py \
https://download.openmmlab.com/mmdetection/v2.0/yolo/yolov3_d53_mstrain-608_273e_coco/
↪ yolov3_d53_mstrain-608_273e_coco_20210518_115020-a2c3acb8.pth \
../mmdetection/demo/demo.jpg \
--work-dir ./work-dirs/mmdet/yolov3/ort/partition
```

After run the script above, we would have the partitioned onnx file `yolov3.onnx` in the `work-dir`. You can use the visualization tool `netron` to check the model structure.

With the partitioned onnx file, you could refer to *useful\_tools.md* to do the following procedures such as `mmdeploy_onnx2ncnn`, `onnx2tensorrt`.

## HOW TO DO REGRESSION TEST

This tutorial describes how to do regression test. The deployment configuration file contains codebase config and inference config.

### 44.1 1. Python Environment

```
pip install -r requirements/tests.txt
```

If pip throw an exception, try to upgrade numpy.

```
pip install -U numpy
```

### 44.2 2. Usage

```
python ./tools/regression_test.py \
  --codebase "${CODEBASE_NAME}" \
  --backends "${BACKEND}" \
  [--models "${MODELS}"] \
  --work-dir "${WORK_DIR}" \
  --device "${DEVICE}" \
  --log-level INFO \
  [--performance -p] \
  [--checkpoint-dir "${CHECKPOINT_DIR}"]
```

#### 44.2.1 Description

- `--codebase` : The codebase to test, eg.`mmdet`. If you want to test multiple codebase, use `mmcls mmdet ...`
- `--backends` : The backend to test. By default, all backends would be tested. You can use `onnxruntime` `tesensorrt` to choose several backends. If you also need to test the SDK, you need to configure the `sdk_config` in `tests/regression/${codebase}.yaml`.
- `--models` : Specify the model to be tested. All models in `yaml` are tested by default. You can also give some model names. For the model name, please refer to the relevant `yaml` configuration file. For example `ResNet SE-ResNet "Mask R-CNN"`. Model name can only contain numbers and letters.
- `--work-dir` : The directory of model convert and report, use `../mmdploy_regression_working_dir` by default.

- `--checkpoint-dir`: The path of downloaded torch model, use `../mmdeploy_checkpoints` by default.
- `--device`: device type, use cuda by default
- `--log-level`: These options are available: 'CRITICAL', 'FATAL', 'ERROR', 'WARN', 'WARNING', 'INFO', 'DEBUG', 'NOTSET'. The default value is INFO.
- `-p` or `--performance`: Test precision or not. If not enabled, only model convert would be tested.

## 44.2.2 Notes

For Windows user:

1. To use the `&&` connector in shell commands, you need to download PowerShell 7 Preview 5+.
2. If you are using conda env, you may need to change `python3` to `python` in `regression_test.py` because there is `python3.exe` in `%USERPROFILE%\AppData\Local\Microsoft\WindowsApps` directory.

## 44.3 Example

1. Test all backends of mmdet and mmpose for **model convert and precision**

```
python ./tools/regression_test.py \  
--codebase mmdet mmpose \  
--work-dir "../mmdeploy_regression_working_dir" \  
--device "cuda" \  
--log-level INFO \  
--performance
```

2. Test **model convert and precision** of some backends of mmdet and mmpose

```
python ./tools/regression_test.py \  
--codebase mmdet mmpose \  
--backends onnxruntime tensorrt \  
--work-dir "../mmdeploy_regression_working_dir" \  
--device "cuda" \  
--log-level INFO \  
-p
```

3. Test some backends of mmdet and mmpose, **only test model convert**

```
python ./tools/regression_test.py \  
--codebase mmdet mmpose \  
--backends onnxruntime tensorrt \  
--work-dir "../mmdeploy_regression_working_dir" \  
--device "cuda" \  
--log-level INFO
```

4. Test some models of mmdet and mmcls, **only test model convert**

```
python ./tools/regression_test.py \  
--codebase mmdet mmpose \  
--models ResNet SE-ResNet "Mask R-CNN" \  
--work-dir "../mmdeploy_regression_working_dir" \  

```

(continues on next page)

(continued from previous page)

```
--device "cuda" \
--log-level INFO
```

## 44.4 3. Regression Test Tonfiguration

### 44.4.1 Example and parameter description

```

## 44.5 4. Generated Report

This is an example of mmocr regression test report.

## 44.6 5. Supported Backends

- [x] ONNX Runtime
- [x] TensorRT
- [x] PPLNN
- [x] ncnn
- [x] OpenVINO
- [x] TorchScript
- [x] SNPE
- [x] MMDeploy SDK

## 44.7 6. Supported Codebase and Metrics

## ONNX EXPORT OPTIMIZER

This is a tool to optimize ONNX model when exporting from PyTorch.

### 45.1 Installation

Build MMDeploy with torchscript support:

```
export Torch_DIR=$(python -c "import torch;print(torch.utils.cmake_prefix_path + '/Torch
↪')")

cmake \
  -DTorch_DIR=${Torch_DIR} \
  -DMMDEPLOY_TARGET_BACKENDS="${your_backend};torchscript" \
  .. # You can also add other build flags if you need

cmake --build . -- -j$(nproc) && cmake --install .
```

### 45.2 Usage

```
# import model_to_graph_custom_optimizer so we can hijack onnx.export
from mmddeploy.apis.onnx.optimizer import model_to_graph_custom_optimizer # noqa
from mmddeploy.core import RewriterContext
from mmddeploy.apis.onnx.passes import optimize_onnx

# load your model here
model = create_model()

# export with ONNX Optimizer
x = create_dummy_input()
with RewriterContext({}, onnx_custom_passes=optimize_onnx):
    torch.onnx.export(model, x, output_path)
```

The model would be optimized after export.

You can also define your own optimizer:

```
# create the optimize callback
def _optimize_onnx(graph, params_dict, torch_out):
```

(continues on next page)

(continued from previous page)

```
from mmdeploy.backend.torchscript import ts_optimizer
ts_optimizer.onnx._jit_pass_onnx_peephole(graph)
return graph, params_dict, torch_out

with RewriterContext({}, onnx_custom_passes=_optimize_onnx):
    # export your model
```

## CROSS COMPILE SNPE INFERENCE SERVER ON UBUNTU 18

mmdeploy has provided a prebuilt package, if you want to compile it by self, or need to modify the .proto file, you can refer to this document.

Note that the official gRPC documentation does not have complete support for the NDK.

### 46.1 1. Environment

### 46.2 2. Cross compile gRPC with NDK

1. Pull gRPC repo, compile protoc and grpc\_cpp\_plugin on host

```
# Install dependencies
$ apt-get update && apt-get install -y libssl-dev
# Compile
$ git clone https://github.com/grpc/grpc --recursive=1 --depth=1
$ mkdir -p cmake/build
$ pushd cmake/build

$ cmake \
  -DCMAKE_BUILD_TYPE=Release \
  -DgRPC_INSTALL=ON \
  -DgRPC_BUILD_TESTS=OFF \
  -DgRPC_SSL_PROVIDER=package \
  ../../..
# Install to host
$ make -j
$ sudo make install
```

2. Download the NDK and cross-compile the static libraries with android aarch64 format

```
$ wget https://dl.google.com/android/repository/android-ndk-r17c-linux-x86_64.zip
$ unzip android-ndk-r17c-linux-x86_64.zip

$ export ANDROID_NDK=/path/to/android-ndk-r17c

$ cd /path/to/grpc
$ mkdir -p cmake/build_aarch64 && pushd cmake/build_aarch64

$ cmake ../../.. \
```

(continues on next page)

(continued from previous page)

```

-DCMAKE_TOOLCHAIN_FILE=${ANDROID_NDK}/build/cmake/android.toolchain.cmake \
-DANDROID_ABI=arm64-v8a \
-DANDROID_PLATFORM=android-26 \
-DANDROID_TOOLCHAIN=clang \
-DANDROID_STL=c++_shared \
-DCMAKE_BUILD_TYPE=Release \
-DCMAKE_INSTALL_PREFIX=/tmp/android_grpc_install_shared

$ make -j
$ make install

```

3. At this point /tmp/android\_grpc\_install should have the complete installation file

```

$ cd /tmp/android_grpc_install
$ tree -L 1
.
├── bin
├── include
├── lib
└── share

```

## 46.3 3. (Skipable) Self-test whether NDK gRPC is available

1. Compile the helloworld that comes with gRPC

```

$ cd /path/to/grpc/examples/cpp/helloworld/
$ mkdir cmake/build_aarch64 -p && pushd cmake/build_aarch64

$ cmake ../.. \
-DANDROID_TOOLCHAIN_FILE=${ANDROID_NDK}/build/cmake/android.toolchain.cmake \
-DANDROID_ABI=arm64-v8a \
-DANDROID_PLATFORM=android-26 \
-DANDROID_STL=c++_shared \
-DANDROID_TOOLCHAIN=clang \
-DCMAKE_BUILD_TYPE=Release \
-Dabsl_DIR=/tmp/android_grpc_install_shared/lib/cmake/absl \
-DProtobuf_DIR=/tmp/android_grpc_install_shared/lib/cmake/protobuf \
-Dgrpc_DIR=/tmp/android_grpc_install_shared/lib/cmake/grpc

$ make -j
$ ls greeter*
greeter_async_client  greeter_async_server  greeter_callback_server  greeter_server
greeter_async_client2  greeter_callback_client  greeter_client

```

2. Turn on debug mode on your phone, push the binary to /data/local/tmp

```
$ adb push greeter* /data/local/tmp
```

3. adb shell into the phone, execute client/server

```
/data/local/tmp $ ./greeter_client
Greeter received: Hello world
```

## 46.4 4. Cross compile snpe inference server

1. Open the [snpe tools website](#) and download version 1.59. Unzip and set environment variables

Note that snpe >= 1.60 starts using clang-8.0, which may cause incompatibility with libc++\_shared. so on older devices.

```
$ export SNPE_ROOT=/path/to/snpe-1.59.0.3230
```

2. Open the snpe server directory within mmdeploy, use the options when cross-compiling gRPC

```
$ cd /path/to/mmdploy
$ cd service/snpe/server

$ mkdir -p build && cd build
$ export ANDROID_NDK=/path/to/android-ndk-r17c
$ cmake .. \
-DMAKE_TOOLCHAIN_FILE=${ANDROID_NDK}/build/cmake/android.toolchain.cmake \
-DANDROID_ABI=arm64-v8a \
-DANDROID_PLATFORM=android-26 \
-DANDROID_STL=c++_shared \
-DANDROID_TOOLCHAIN=clang \
-DCMAKE_BUILD_TYPE=Release \
-Dabsl_DIR=/tmp/android_grpc_install_shared/lib/cmake/absl \
-DProtobuf_DIR=/tmp/android_grpc_install_shared/lib/cmake/protobuf \
-DgRPC_DIR=/tmp/android_grpc_install_shared/lib/cmake/grpc

$ make -j
$ file inference_server
inference_server: ELF 64-bit LSB shared object, ARM aarch64, version 1 (SYSV),
↳dynamically linked, interpreter /system/bin/linker64,
↳BuildID[sha1]=252aa04e2b982681603dacb74b571be2851176d2, with debug_info, not stripped
```

Finally, you can see infernece\_server, adb push it to the device and execute.

## 46.5 5. Regenerate the proto interface

If you have changed inference.proto, you need to regenerate the .cpp and .py interfaces

```
$ python3 -m pip install grpc_tools --user
$ python3 -m grpc_tools.protoc -I./ --python_out=./client/ --grpc_python_out=./client/ \
↳inference.proto

$ ln -s `which protoc-gen-grpc`
$ protoc --cpp_out=./ --grpc_out=./ --plugin=protoc-gen-grpc=grpc_cpp_plugin inference.
↳proto
```

## 46.6 Reference

- snpe tutorial [https://developer.qualcomm.com/sites/default/files/docs/snpe/cplus\\_plus\\_tutorial.html](https://developer.qualcomm.com/sites/default/files/docs/snpe/cplus_plus_tutorial.html)
- gRPC cross build script [https://raw.githubusercontent.com/grpc/grpc/master/test/distrib/cpp/run\\_distrib\\_test\\_cmake\\_aarch64\\_cross\\_build.sh](https://raw.githubusercontent.com/grpc/grpc/master/test/distrib/cpp/run_distrib_test_cmake_aarch64_cross_build.sh)
- stackoverflow <https://stackoverflow.com/questions/54052229/build-grpc-c-for-android-using-ndk-arm-linux-androideabi-clang-compiler>

## FREQUENTLY ASKED QUESTIONS

### 47.1 TensorRT

- “WARNING: Half2 support requested on hardware without native FP16 support, performance will be negatively affected.”

Fp16 mode requires a device with full-rate fp16 support.

- “error: parameter check failed at: engine.cpp::setBindingDimensions::1046, condition: profileMinDims.d[i] <= dimensions.d[i]”

When building an ICudaEngine from an INetworkDefinition that has dynamically resizable inputs, users need to specify at least one optimization profile. Which can be set in deploy config:

```
backend_config = dict(
    common_config=dict(max_workspace_size=1 << 30),
    model_inputs=[
        dict(
            input_shapes=dict(
                input=dict(
                    min_shape=[1, 3, 320, 320],
                    opt_shape=[1, 3, 800, 1344],
                    max_shape=[1, 3, 1344, 1344]))))
    ])
```

The input tensor shape should be limited between min\_shape and max\_shape.

- “error: [TensorRT] INTERNAL ERROR: Assertion failed: cublasStatus == CUBLAS\_STATUS\_SUCCESS”

TRT 7.2.1 switches to use cuBLASLt (previously it was cuBLAS). cuBLASLt is the defaulted choice for SM version >= 7.0. You may need CUDA-10.2 Patch 1 (Released Aug 26, 2020) to resolve some cuBLASLt issues. Another option is to use the new TacticSource API and disable cuBLASLt tactics if you dont want to upgrade.

### 47.2 Libtorch

- Error: libtorch/share/cmake/Caffe2/Caffe2Config.cmake:96 (message):Your installed Caffe2 version uses cuDNN but I cannot find the cuDNN libraries. Please set the proper cuDNN prefixes and / or install cuDNN.

May export CUDNN\_ROOT=/root/path/to/cudnn to resolve the build error.

## 47.3 Windows

- Error: similar like this `OSError: [WinError 1455] The paging file is too small for this operation to complete. Error loading "C:\Users\cx\miniconda3\lib\site-packages\torch\lib\cudnn_cnn_infer64_8.dll" or one of its dependencies`

Solution: according to this [post](#), the issue may be caused by NVidia and will fix in *CUDA release 11.7*. For now one could use the `fixNvPe.py` script to modify the nvidia dlls in the pytorch lib dir.

```
python fixNvPe.py --input=C:\Users\user\AppData\Local\Programs\Python\Python38\lib\site-packages\torch\lib\*.dll
```

You can find your pytorch installation path with:

```
import torch
print(torch.__file__)
```

- `enable_language(CUDA)` error

```
-- Selecting Windows SDK version 10.0.19041.0 to target Windows 10.0.19044.
-- Found CUDA: C:/Program Files/NVIDIA GPU Computing Toolkit/CUDA/v11.1 (found
↪version "11.1")

↪MMDeploy/MMDeployConfig.cmake:27 (enable_language)
  CMakeLists.txt:5 (find_package)
```

**Cause** CUDA Toolkit 11.1 was installed before Visual Studio, so the VS plugin was not installed. Or the version of VS is too new, so that the installation of the VS plugin is skipped during the installation of the CUDA Toolkit

**Solution** This problem can be solved by manually copying the four files in `C:\Program Files\NVIDIA GPU Computing Toolkit\CUDA\v11.1\extras\visual_studio_integration\MSBuildExtensions` to `C:\Software\Microsoft Visual Studio\2022\Community\MSbuild\Microsoft\VC\v170\BuildCustomizations`. The specific path should be changed according to the actual situation.

## 47.4 ONNX Runtime

- Under Windows system, when visualizing model inference result failed with the following error:

```
onnxruntime.capi.onnxruntime_pybind11_state.Fail: [ONNXRuntimeError] : 1 : FAIL :
↪Failed to load library, error code: 193
```

**Cause** In latest Windows systems, there are two `onnxruntime.dll` under the system path, and they will be loaded first, causing conflicts.

```
C:\Windows\SysWOW64\onnxruntime.dll  
C:\Windows\System32\onnxruntime.dll
```

**Solution** Choose one of the following two options

1. Copy the dll in the lib directory of the downloaded onnxruntime to the directory where mmdeploy\_onnxruntime\_ops.dll locates (It is recommended to use Everything to search the ops dll)
2. Rename the two dlls in the system path so that they cannot be loaded.

## 47.5 Pip

- pip installed package but could not import them.

Make sure your are using conda pip.

```
$ which pip  
# /path/to/.local/bin/pip  
/path/to/miniconda3/lib/python3.9/site-packages/pip
```

CHAPTER  
**FORTYNINE**

---

`mmdeploy.apis.build_task_processor(model_cfg: mmengine.config.config.Config, deploy_cfg: mmengine.config.config.Config, device: str) → mmdeploy.codebase.base.task.BaseTask`

Build a task processor to manage the deployment pipeline.

**Parameters**

- **model\_cfg** (*str* | *mmengine.Config*) – Model config file.
- **deploy\_cfg** (*str* | *mmengine.Config*) – Deployment config file.
- **device** (*str*) – A string specifying device type.

**Returns** A task processor.

**Return type** BaseTask

`mmdeploy.apis.create_calib_input_data(calib_file: str, deploy_cfg: Union[str, mmengine.config.config.Config], model_cfg: Union[str, mmengine.config.config.Config], model_checkpoint: Optional[str] = None, dataset_cfg: Optional[Union[str, mmengine.config.config.Config]] = None, dataset_type: str = 'val', device: str = 'cpu') → None`

Create dataset for post-training quantization.

**Parameters**

- **calib\_file** (*str*) – The output calibration data file.
- **deploy\_cfg** (*str* | *Config*) – Deployment config file or Config object.
- **model\_cfg** (*str* | *Config*) – Model config file or Config object.
- **model\_checkpoint** (*str*) – A checkpoint path of PyTorch model, defaults to *None*.
- **dataset\_cfg** (*Optional[Union[str, Config]]*, *optional*) – Model config to provide calibration dataset. If none, use *model\_cfg* as the dataset config. Defaults to *None*.
- **dataset\_type** (*str*, *optional*) – The dataset type. Defaults to 'val'.
- **device** (*str*, *optional*) – Device to create dataset. Defaults to 'cpu'.

`mmdeploy.apis.extract_model(model: Union[str, onnx.onnx_ml_pb2.ModelProto], start_marker: Union[str, Iterable[str]], end_marker: Union[str, Iterable[str]], start_name_map: Optional[Dict[str, str]] = None, end_name_map: Optional[Dict[str, str]] = None, dynamic_axes: Optional[Dict[str, Dict[int, str]]] = None, save_file: Optional[str] = None) → onnx.onnx_ml_pb2.ModelProto`

Extract partition-model from an ONNX model.

The partition-model is defined by the names of the input and output tensors exactly.

## Examples

```
>>> from mmdeploy.apis import extract_model
>>> model = 'work_dir/fastrcnn.onnx'
>>> start_marker = 'detector:input'
>>> end_marker = ['extract_feat:output', 'multiclass_nms[0]:input']
>>> dynamic_axes = {
    'input': {
        0: 'batch',
        2: 'height',
        3: 'width'
    },
    'scores': {
        0: 'batch',
        1: 'num_boxes',
    },
    'boxes': {
        0: 'batch',
        1: 'num_boxes',
    }
}
>>> save_file = 'partition_model.onnx'
>>> extract_model(model, start_marker, end_marker, dynamic_
↪ axes=dynamic_axes, save_file=save_file)
```

## Parameters

- **model** (*str* | *onnx.ModelProto*) – Input ONNX model to be extracted.
- **start\_marker** (*str* | *Sequence[str]*) – Start marker(s) to extract.
- **end\_marker** (*str* | *Sequence[str]*) – End marker(s) to extract.
- **start\_name\_map** (*Dict[str, str]*) – A mapping of start names, defaults to *None*.
- **end\_name\_map** (*Dict[str, str]*) – A mapping of end names, defaults to *None*.
- **dynamic\_axes** (*Dict[str, Dict[int, str]]*) – A dictionary to specify dynamic axes of input/output, defaults to *None*.
- **save\_file** (*str*) – A file to save the extracted model, defaults to *None*.

**Returns** The extracted model.

**Return type** *onnx.ModelProto*

`mmdeploy.apis.get_predefined_partition_cfg(deploy_cfg: mmengine.config.config.Config, partition_type: str)`

Get the predefined partition config.

## Notes

Currently only support mmdet codebase.

### Parameters

- **deploy\_cfg** (*mmengine.Config*) – use deploy config to get the codebase and task type.
- **partition\_type** (*str*) – A string specifying partition type.

**Returns** A dictionary of partition config.

**Return type** dict

```
mmdeploy.apis.inference_model(model_cfg: Union[str, mmengine.config.config.Config], deploy_cfg:
                               Union[str, mmengine.config.config.Config], backend_files: Sequence[str],
                               img: Union[str, numpy.ndarray], device: str) → Any
```

Run inference with PyTorch or backend model and show results.

## Examples

```
>>> from mmdeploy.apis import inference_model
>>> model_cfg = ('mmdetection/configs/fcos/'
                 'fcos_r50_caffe_fpn_gn-head_1x_coco.py')
>>> deploy_cfg = ('configs/mmdet/detection/'
                  'detection_onnxruntime_dynamic.py')
>>> backend_files = ['work_dir/fcos.onnx']
>>> img = 'demo.jpg'
>>> device = 'cpu'
>>> model_output = inference_model(model_cfg, deploy_cfg,
                                   backend_files, img, device)
```

### Parameters

- **model\_cfg** (*str* | *mmengine.Config*) – Model config file or Config object.
- **deploy\_cfg** (*str* | *mmengine.Config*) – Deployment config file or Config object.
- **backend\_files** (*Sequence[str]*) – Input backend model file(s).
- **img** (*str* | *np.ndarray*) – Input image file or numpy array for inference.
- **device** (*str*) – A string specifying device type.

**Returns** The inference results

**Return type** Any

```
mmdeploy.apis.torch2onnx(img: Any, work_dir: str, save_file: str, deploy_cfg: Union[str,
mmengine.config.config.Config], model_cfg: Union[str,
mmengine.config.config.Config], model_checkpoint: Optional[str] = None, device:
str = 'cuda:0')
```

Convert PyTorch model to ONNX model.

## Examples

```
>>> from mmdet.apis import torch2onnx
>>> img = 'demo.jpg'
>>> work_dir = 'work_dir'
>>> save_file = 'fcos.onnx'
>>> deploy_cfg = ('configs/mmdet/detection/'
                  'detection_onnxruntime_dynamic.py')
>>> model_cfg = ('mmdetection/configs/fcos/'
                 'fcos_r50_caffe_fpn_gn-head_1x_coco.py')
>>> model_checkpoint = ('checkpoints/'
                       'fcos_r50_caffe_fpn_gn-head_1x_coco-821213aa.pth')
>>> device = 'cpu'
>>> torch2onnx(img, work_dir, save_file, deploy_cfg, model_cfg, model_
               ↪checkpoint, device)
```

### Parameters

- **img** (*str* | *np.ndarray* | *torch.Tensor*) – Input image used to assist converting model.
- **work\_dir** (*str*) – A working directory to save files.
- **save\_file** (*str*) – Filename to save onnx model.
- **deploy\_cfg** (*str* | *mmengine.Config*) – Deployment config file or Config object.
- **model\_cfg** (*str* | *mmengine.Config*) – Model config file or Config object.
- **model\_checkpoint** (*str*) – A checkpoint path of PyTorch model, defaults to *None*.
- **device** (*str*) – A string specifying device type, defaults to 'cuda:0'.

`mmdet.apis.torch2torchscript`(*img*: Any, *work\_dir*: str, *save\_file*: str, *deploy\_cfg*: Union[str, mmengine.config.config.Config], *model\_cfg*: Union[str, mmengine.config.config.Config], *model\_checkpoint*: Optional[str] = None, *device*: str = 'cuda:0')

Convert PyTorch model to torchscript model.

### Parameters

- **img** (*str* | *np.ndarray* | *torch.Tensor*) – Input image used to assist converting model.
- **work\_dir** (*str*) – A working directory to save files.
- **save\_file** (*str*) – Filename to save torchscript model.
- **deploy\_cfg** (*str* | *mmengine.Config*) – Deployment config file or Config object.
- **model\_cfg** (*str* | *mmengine.Config*) – Model config file or Config object.
- **model\_checkpoint** (*str*) – A checkpoint path of PyTorch model, defaults to *None*.
- **device** (*str*) – A string specifying device type, defaults to 'cuda:0'.

```
mmdeploy.apis.visualize_model(model_cfg: Union[str, mmengine.config.config.Config], deploy_cfg:
    Union[str, mmengine.config.config.Config], model: Union[str,
    Sequence[str]], img: Union[str, numpy.ndarray, Sequence[str]], device: str,
    backend: Optional[mmdeploy.utils.constants.Backend] = None, output_file:
    Optional[str] = None, show_result: bool = False, **kwargs)
```

Run inference with PyTorch or backend model and show results.

## Examples

```
>>> from mmdeploy.apis import visualize_model
>>> model_cfg = ('mmdetection/configs/fcos/'
    'fcos_r50_caffe_fpn_gn-head_1x_coco.py')
>>> deploy_cfg = ('configs/mmdet/detection/'
    'detection_onnxruntime_dynamic.py')
>>> model = 'work_dir/fcos.onnx'
>>> img = 'demo.jpg'
>>> device = 'cpu'
>>> visualize_model(model_cfg, deploy_cfg, model,          img, device, show_
    result=True)
```

## Parameters

- **model\_cfg** (*str* | *mmengine.Config*) – Model config file or Config object.
- **deploy\_cfg** (*str* | *mmengine.Config*) – Deployment config file or Config object.
- **model** (*str* | *Sequence[str]*) – Input model or file(s).
- **img** (*str* | *np.ndarray* | *Sequence[str]*) – Input image file or numpy array for inference.
- **device** (*str*) – A string specifying device type.
- **backend** (*Backend*) – Specifying backend type, defaults to *None*.
- **output\_file** (*str*) – Output file to save visualized image, defaults to *None*. Only valid if *show\_result* is set to *False*.
- **show\_result** (*bool*) – Whether to show plotted image in windows, defaults to *False*.

## APIS/TENSORRT

```
mmdeploy.apis.tensorrt.from_onnx(onnx_model: Union[str, onnx.onnx_ml_pb2.ModelProto],  
                                output_file_prefix: str, input_shapes: Dict[str, Sequence[int]],  
                                max_workspace_size: int = 0, fp16_mode: bool = False, int8_mode: bool  
                                = False, int8_param: Optional[dict] = None, device_id: int = 0,  
                                log_level: tensorrt.Logger.Severity = tensorrt.Logger.ERROR, **kwargs)  
                                → tensorrt.ICudaEngine
```

Create a tensorrt engine from ONNX.

### Parameters

- **onnx\_model** (*str* or *onnx.ModelProto*) – Input onnx model to convert from.
- **output\_file\_prefix** (*str*) – The path to save the output ncnn file.
- **input\_shapes** (*Dict[str, Sequence[int]]*) – The min/opt/max shape of each input.
- **max\_workspace\_size** (*int*) – To set max workspace size of TensorRT engine. some tactics and layers need large workspace. Defaults to 0.
- **fp16\_mode** (*bool*) – Specifying whether to enable fp16 mode. Defaults to *False*.
- **int8\_mode** (*bool*) – Specifying whether to enable int8 mode. Defaults to *False*.
- **int8\_param** (*dict*) – A dict of parameter int8 mode. Defaults to *None*.
- **device\_id** (*int*) – Choice the device to create engine. Defaults to 0.
- **log\_level** (*trt.Logger.Severity*) – The log level of TensorRT. Defaults to *trt.Logger.ERROR*.

**Returns** The TensorRT engine created from onnx\_model.

**Return type** tensorrt.ICudaEngine

### Example

```
>>> from mmdeploy.apis.tensorrt import from_onnx  
>>> engine = from_onnx(  
>>>     "onnx_model.onnx",  
>>>     {'input': {"min_shape" : [1, 3, 160, 160],  
>>>                "opt_shape" : [1, 3, 320, 320],  
>>>                "max_shape" : [1, 3, 640, 640]}}},  
>>>     log_level=trt.Logger.WARNING,  
>>>     fp16_mode=True,  
>>>     max_workspace_size=1 << 30,
```

(continues on next page)

(continued from previous page)

```
>>>         device_id=0)
>>>     })
```

`mmdeploy.apis.tensorrt.is_available(with_custom_ops: bool = False) → bool`

Check whether backend is installed.

**Parameters** `with_custom_ops` (*bool*) – check custom ops exists.

**Returns** True if backend package is installed.

**Return type** *bool*

`mmdeploy.apis.tensorrt.load(path: str, allocator: Optional[Any] = None) → tensorrt.ICudaEngine`

Deserialize TensorRT engine from disk.

**Parameters**

- **path** (*str*) – The disk path to read the engine.
- **allocator** (*Any*) – gpu allocator

**Returns** The TensorRT engine loaded from disk.

**Return type** *tensorrt.ICudaEngine*

`mmdeploy.apis.tensorrt.onnx2tensorrt(work_dir: str, save_file: str, model_id: int, deploy_cfg: Union[str, mmengine.config.config.Config], onnx_model: Union[str, onnx.onnx_ml_pb2.ModelProto], device: str = 'cuda:0', partition_type: str = 'end2end', **kwargs)`

Convert ONNX to TensorRT.

## Examples

```
>>> from mmdeploy.backend.tensorrt.onnx2tensorrt import onnx2tensorrt
>>> work_dir = 'work_dir'
>>> save_file = 'end2end.engine'
>>> model_id = 0
>>> deploy_cfg = ('configs/mmdet/detection/'
                  'detection_tensorrt_dynamic-320x320-1344x1344.py')
>>> onnx_model = 'work_dir/end2end.onnx'
>>> onnx2tensorrt(work_dir, save_file, model_id, deploy_cfg,
                  onnx_model, 'cuda:0')
```

**Parameters**

- **work\_dir** (*str*) – A working directory.
- **save\_file** (*str*) – The base name of the file to save TensorRT engine. E.g. *end2end.engine*.
- **model\_id** (*int*) – Index of input model.
- **deploy\_cfg** (*str* | *mmengine.Config*) – Deployment config.
- **onnx\_model** (*str* | *onnx.ModelProto*) – input onnx model.
- **device** (*str*) – A string specifying cuda device, defaults to ‘cuda:0’.
- **partition\_type** (*str*) – Specifying partition type of a model, defaults to ‘end2end’.

`mmdeploy.apis.tensorrt.save(engine: Any, path: str) → None`  
Serialize TensorRT engine to disk.

**Parameters**

- **engine** (*Any*) – TensorRT engine to be serialized.
- **path** (*str*) – The absolute disk path to write the engine.

## APIS/ONNXRUNTIME

`mmdeploy.apis.onnxruntime.is_available(with_custom_ops: bool = False) → bool`

Check whether backend is installed.

**Parameters** `with_custom_ops` (*bool*) – check custom ops exists.

**Returns** True if backend package is installed.

**Return type** bool

## APIS/NCNN

`mmdeploy.apis.ncnn.from_onnx`(*onnx\_model: Union[onnx.onnx\_ml\_pb2.ModelProto, str]*, *output\_file\_prefix: str*)

Convert ONNX to ncnn.

The inputs of ncnn include a model file and a weight file. We need to use an executable program to convert the .onnx file to a .param file and a .bin file. The output files will save to work\_dir.

### Example

```
>>> from mmdeploy.apis.ncnn import from_onnx
>>> onnx_path = 'work_dir/end2end.onnx'
>>> output_file_prefix = 'work_dir/end2end'
>>> from_onnx(onnx_path, output_file_prefix)
```

### Parameters

- **onnx\_path** (*ModelProto*/*str*) – The path of the onnx model.
- **output\_file\_prefix** (*str*) – The path to save the output ncnn file.

`mmdeploy.apis.ncnn.is_available`(*with\_custom\_ops: bool = False*) → bool

Check whether backend is installed.

**Parameters** **with\_custom\_ops** (*bool*) – check custom ops exists.

**Returns** True if backend package is installed.

**Return type** bool

## APIS/PPLNN

`mmdeploy.apis.pplnn.is_available(with_custom_ops: bool = False) → bool`  
Check whether backend is installed.

**Parameters** `with_custom_ops` (*bool*) – check custom ops exists.

**Returns** True if backend package is installed.

**Return type** bool
